common fault in many software development environments is a focus on functional requirements the what and how to the detriment of performance requirements which specify instead how well software should function assessed through software execution or how easily software should be maintained assessed through code inspection Without the definition and communication of performance requirements developers risk either building software that lacks intended quality or wasting time delivering software that exceeds performance objectives thus either underperforming or gold plating both of which are undesirable Managers customers and other decision makers should also understand the dimensions of software quality both to define performance requirements at project outset as well as to evaluate whether those objectives were met at software completion As data analytic software SAS transforms data into information and ultimately knowledge and data driven decisions Not surprisingly data quality is a central focus and theme of SAS literature however code quality is far less commonly described and too often references only the speed or efficiency with which software should execute omitting other critical dimensions of software quality SAS software project definitions and technical requirements often fall victim to this paradox in which rigorous quality requirements exist for data and data products yet not for the software that undergirds them By demonstrating the cost and benefits of software quality inclusion and the risk of software quality exclusion stakeholders learn to value prioritize implement and evaluate dimensions of software quality within risk management and project management frameworks of the software development life cycle SDLC Thus SAS Data Analytic Development recalibrates business value placing code quality on par with data quality and performance requirements on par with functional requirements
