

STREAMS

Fragile eggs nestled in gravel hatch into tiny fry that emerge to feed. These vulnerable young salmon need cold, clean freshwater, abundant insects for nutrition, and sheltered habitat to survive.

RIVERS

As fry begin their perilous journey to the sea, they need complex riparian habitat: quiet side channels and ponds, soft edges instead of riprap and levees and forested wetlands and marshes that offer cover from predators.

ESTUARIES

Where saltwater meets fresh, salmon fry become smolts, adapting to marine conditions through osmoregulation among other processes. As they undergo this transition, they need brackish-water marsh habitat to hide and feed heavily in preparation for life in the open ocean.

OCEANS

After adapting for life in the sea, or smolting, salmon leave their estuarine sanctuary to mature in the ocean, with some salmon traveling thousands of miles before returning home to spawn.

Saving Science A Critique Of Science And Its Role In Salmon Recovery:

Saving Science T. C. Dewberry, 2004-01-01 Almost everyone assumes that sound science is the best hope for saving Pacific Northwest salmonids But what is sound science From his unique perspective Dr Charley Dewberry examines the background assumptions and inconsistencies behind the common view of science Conservation of Columbia Basin Fish: Regional coordination and public involvement, 2000 **Science and the Endangered Species Act** Committee on Scientific Issues in the Endangered Species Act, Commission on Life Sciences, Division on Earth and Life Studies, National Research Council, 1995-10-27 The Endangered Species Act ESA is a far reaching law that has sparked intense controversies over the use of public lands the rights of property owners and economic versus environmental benefits In this volume a distinguished committee focuses on the science underlying the ESA and offers recommendations for making the act more effective The committee provides an overview of what scientists know about extinction and what this understanding means to implementation of the ESA Habitat its destruction conservation and fundamental importance to the ESA is explored in detail The book analyzes Concepts of species how the term species arose and how it has been interpreted for purposes of the ESA Conflicts between species when individual species are identified for protection including several case studies Assessment of extinction risk and decisions under the ESA how these decisions can be made more effectively The book concludes with a look beyond the Endangered Species Act and suggests additional means of biological conservation and ways to reduce conflicts It will be useful to policymakers regulators scientists natural resource managers industry and environmental organizations and those interested in biological conservation Science and Politics Brent S. Steel, 2014-04-21 Recent partisan squabbles over science in the news are indicative of a larger tendency for scientific research and practice to get entangled in major ideological divisions in the public arena This politicization of science is deepened by the key role government funding plays in scientific research and development the market leading position of U S based science and technology firms and controversial U S exports such as genetically modified foods or hormone injected livestock This groundbreaking one volume A to Z reference features 120 150 entries that explore the nexus of politics and science both in the United States and in U S interactions with other nations The essays each by experts in their fields examine Health environmental and social cultural issues relating to science and politics Concerns relating to government regulation and its impact on the practice of science Key historical and contemporary events that have shaped our contemporary view of how science and politics intersect *Science and Politics An A to Z Guide to Issues and Controversies* is a must have resource for researchers and students who seek to deepen their understanding of the connection between science and politics
