Reevaluation Of The State Of The Science For Waterquality Criteria Development:

Developing Ambient Water Quality Criteria for Mercury D. R. J. Moore, A. Pawlisz, R. S. Teed, 2003-07-31 This project examined the development of ambient water quality criteria AWQC for the protection of wildlife for mercury. Mercury is considered a serious risk to wildlife in many areas. As a result the Great Lakes Water Quality Initiative and others have developed AWQC. These AWQC have been controversial however because 1 the AWQC were single values that did not account for site specific conditions 2 derivation of the AWQC relied on a single NOAEL and 3 the AWQC had an unknown level of conservatism because of reliance on both average and conservative assumptions and uncertainty factors. Rather than develop a single value AWQC for total mercury we derive an AWQC model that explicitly incorporates factors controlling bioavailability, methylation rates and bioaccumulation in the aquatic environment e.g. pH, DOC, sulfate. To derive our AWQC model field data was collected including numerous water quality parameters and total mercury and methylmercury concentrations in whole body fish tissue from 31 lakes in Ontario and an additional 10 lakes in Nova Scotia. An independent dataset consisting of 51 water bodies in the United States was then used to confirm the validity and robustness of the AWQC model. Next we combined the results of chronic feeding studies with similar protocols and endpoints in a meta analysis to derive a dose response curve for mink exposed to mercury in the diet. Using this approach one can derive an LD5 or other similar endpoint that can then be used as the basis for deriving wildlife AWQC. In the final step we used a probabilistic risk model to estimate the concentrations of methylmercury in water that would lead to levels in fish sufficient for there to be a 10% probability of exceeding the mink LD5. This analysis was repeated for various combinations of pH and DOC. The result is an AWQC model for mercury for the protection of wildlife that can be used for a variety of site specific conditions. Application of Uncertainty Analysis to Ecological Risks of Pesticides William J. Warren-Hicks, Andy Hart, 2010-04-07 While current methods used in ecological risk assessments for pesticides are largely deterministic probabilistic methods that aim to quantify variability and uncertainty in exposure and effects are attracting growing interest from industries and governments Probabilistic methods offer more realistic and meaningful estimates of risk and hence pot
