**Rockbursts and Seismicity in Mines 93** R. Paul Young, 1993-01-01 These proceedings include the latest developments in research and practice in the area of mining induced seismicity Three themes are explored strong ground motion and rockburst hazard mechanics of seismic events and stochastic methods and monitoring of seismicity and geomechanical modelling Induced Seismic Events Peter Knoll, Georg Kowalle, 2012-12-06 Induced seismic events are of high scientific and economic significance They are the result of human activities interacting with regional and local tectonics changing the local crustal stress state by mining extraction of rock masses injection of fluids into the rock massif and by changing the surface loading and pore pressure state near large reservoirs Within Europe the study of induced seismic events has a long tradition and international scientific organizations have actively stimulated the co operation in this field During its General Assembly in September 1994 the European Seismological Society organized the symposium Induced Seismic Events The focus of this symposium was concentrated on induced events in central and eastern Europe as well as in the former Soviet Union The major contributions to the symposium and also some Chinese Canadian and South African results are presented here Case studies as well as data analyses and methodological studies are included Seismologists and specialists working in the field of geohazard prevention will find much information in this volume that is pertinent to their work **Acoustic Emission/Microseismic Activity** Jr., H. Mendecki,2012-12-06 Routine seismic monitoring in mines was introduced over 30 years ago with two main objectives in mind immediate location of larger seismic events to guide rescue operations prediction of large rockmass instabilities The first objective was achieved fairly quickly but with the subsequent development of mine communication systems its strategic importance has diminished The very limited success with prediction can at least partially be attributed to three factors seismic monitoring systems based on analogue technology that provided noisy and frequently poorly calibrated data of limited dynamic range the non quantitative description of a seismic event by at best its local magnitude and the resultant non quantitative analysis of seismicity frequently through parameters of some statistical distributions with a somewhat loose but imaginative physical interpretation The introduction of modern digital seismic systems to mines and progress in the theory and methods of quantitative seismology have enabled the implementation of realtime seismic monitoring as a management tool quantifying rockmass response to mining and achieving the first tangible results with prediction A seismic event being a sudden inelastic deformation within the rockmass can now routinely be quantified in terms of seismic moment its tensor and radiated seismic energy so that the overall size of and stress released at the seismic source can be estimated **Numerical Examination of Mining-induced Seismicity** Mark Patrick Board,1994 **CIM Bulletin** Canadian Institute of Mining and Metallurgy,1996 Acoustic Emission/microseismic Activity in Geologic Structures and Materials Henry Reginald Hardy,1998 **New Publications** United States.
