The Natural History of Igneous Rocks Alfred Harker, 1909

Siberian Traps and Pt-Cu-Ni Deposits in the Noril'sk Area Nadezhda A. Krivolutsкая, 2015-12-09

This book addresses fundamental problems in the evolution of magmatic and ore-forming processes in the Noril'sk area of northern Central Siberia. Based on data on the geology and geochemistry of rocks obtained by the author in the course of fieldworks and new analytical studies applying XRF, ICP-MS, microprobe analysis, ion probe analysis and studying melt and fluid inclusions in olivine as well as stable and radiogenic isotopes in the rocks, it was proposed a new scheme for the evolution of magmatism including two episodes: rift and trap per se. The ultramafic mafic massifs are classified into three geochemical types, the most important of which the ore-bearing Noril'sk type was formed in post-Nadezhdinsky time as an independent pulse of magmatic activity. The primary melts for ore-bearing intrusions had tholeiitic composition with elevated MgO (8 wt%) and low volatile contents. Data from melt inclusions in olivine and pyroxenes in combination with numerical simulations using the COMAGMAT program package. The assimilation of host rocks by the parental melts was studied in the contact zones of the Maslovsky and Talnakh intrusions. It was shown that it had taken place only in narrow zones about 1–2 m and did not play a sufficient role in ore formation. It was suggested that the source of the material was lower crustal rocks in long-lived rift zones where sulfides accumulated in several stages. The book offers a valuable resource for specialists in the geology of ore deposits and petrology as well as for advanced Geology students.

Evolution of Magmatic and Diamond-Forming Systems of the Earth's Lower Mantle Anna V. Spivak, Yuriy A. Litvin, 2018-05-31

This book sheds valuable new light on the genetic mineralogy of lower mantle diamonds and syngenetic minerals. It presents groundbreaking experimental results revealing the melting relations of ultrabasic and basic associations and a physicochemical peritectic mechanism of their evolution. The experimental investigations included here reveal the key multicomponent multiphase oxide-silicate-carbonate-carbon parental media for lower mantle diamonds and syngenetic minerals. Consequently, readers will find extensive information on the diamond-parental oxide-silicate-carbonate-carbon melts/solutions that supplement the general features of lower mantle diamond genesis and the most efficient ultrabasic-basic evolution. The experimental results on physicochemical

aspects combined with analytical mineralogy data make it possible to create a generalized composition diagram of the diamond parental melts solutions there by completing the mantle carbonatite concept for the genesis of lower mantle diamonds and syngenetic minerals This book addresses the needs of all researchers studying the Earth's deepest structure super deep mineral formation including diamonds and magmatic evolution **World-Class Mineral Deposits of Northeastern Transbaikalia, Siberia, Russia** Bronislav Gongalsky, Nadezhda Krivolutsкая, 2019-02-07 This book describes for the first time the complexity of the Northeastern Transbaikalia province of Russia This province is one of the largest Early Proterozoic metallogenic provinces on Earth It comprises three extra large deposits Cu sandstones Udokan Fe Ti V and Cu PGE Chney and REE Katugin This book is a research study and includes geological mineralogical and geochemical data obtained by the authors from 30 field trips in the region using XRF ICP MS La ICP MS EPMA and the study of Sr Nd U Pb isotopes in rocks and minerals It demonstrates the complicated origin of Cu deposits comprising 50 Mt copper concentrated in sedimentary and magmatic rocks in this area **Zircon** John M. Hancher, Paul W. O.
