Käufl, Ralf Siebenmorgen, 2013-06-29 This ESO workshop which took place in September 1995 on a topic that at a first glance could be considered rather specialized attracted an unpredictably large number of scientists This certainly reflects the importance of this field which has lost its seemingly esoteric character in a wider astrophysical context To give as much room as possible in these proceedings to the targeted talks no presentation of the Very Large Telescope Observatory has been included All readers missing such a presentation are reminded that up to date in depth information about the VLT status is available electronically 1 Papers were given concerning observations in the entire electromagnetic spectrum from x rays to mm waves i e exceeding 22 octaves in frequency The VLT as any ground based optical observatory can only address at best 7 octaves Nevertheless the VLT most likely the only ground based observatory specifically designed to access all these 7 octaves of the electromagnetic spectrum practically in parallel will undoubtedly be a tool of extreme value to this field [Literature 1979, Part 1](#) Siegfried Böhme, Ute Esser, Professor Dr. Walter Fricke, Inge Heinrich, Wilfried Hofmann, Dietlinde Krahn, Dorothea Rosa, Dr. Lutz D. Wolf-Rayet Stars Karel A. van der Hucht, Peredur M. Williams, 2012-12-06 In this IAU Symposium on Wolf Rayet stars binary aspects received ample attention notably because of the recognition that many observations of spectral and photometric variability at all accessible wavelengths are related to colliding winds or other forms of wind interaction The basic structure of the conference and its proceedings is basic parameters and general properties of WR stars state of the art model atmospheres for WR stars anisotropic mass loss and disk formation of WR stars properties of WR binaries influence of stellar winds on mass transfer in hot massive binary evolution dust formation near WR stars and other circumstellar phenomena and hydrodynamics and high energy physics of colliding winds in WR O binaries and of WR winds interacting with compact objects Within this framework 20 invited reviews 38 invited oral contributions and 76 poster papers were presented at the Symposium entertaining 111 astronomers from 24 countries These proceedings provide up to date information on all aspects of Wolf Rayet atmospheres binaries and colliding winds **The Carbon Star Phenomenon**

Williams, 2012-12-06 The conference recorded in this volume was one of the events organised to celebrate the centenary of

the re establishment of the Royal Observatory Edinburgh on Blackford Hill in 1884 Circumstellar Matter was selected as the topic because of important contributions toward research in the field by recent observations in the infrared and submillimetre particularly with the two telescopes which the Observatory has both operated and built instrumentation for the United Kingdom Infrared Telescope UKIRT and the James Clerk Maxwell Telescope JCMT The programme aimed to cover as many aspects of circumstellar matter as could fit into a one week meeting omitting only planetary nebulae which had been well served by meetings in the previous two years We thank the international scientific advisory committee overleaf for their help in selecting the Invited Reviewers around which the programme was built The Invited Reviews and oral contributions are included in the order and sections in which they were presented even where re ordering might have been more logical We did not attempt to categorise the poster contributions but have included them in alphabetical order An evening session for viewing and discussing posters in an unhurried atmosphere was very successful A competition for the best poster was held and the prize was awarded for that by Lindqvist Lucas Olofsson Omont Eriksson Gustafsson

Physics and Astrophysics of Ultra High

Energy Cosmic Rays M. Lemoine, G. Sigl, 2008-01-11 The International School on Physics and Astrophysics of Ultra High Energy Cosmic Rays UHECR2000 was held at the Observatoire de Paris Meudon on June 26-29 2000. This was the first international school specifically dedicated to ultra high energy cosmic rays. Its aim was to familiarize with and attract students, physicists and astronomers into this quickly developing new research field. The mysterious and currently unknown origin of the most energetic particles observed in Nature has triggered in recent years theoretical speculations ranging from electromagnetic acceleration to as yet undiscovered physics beyond the Standard Model. It has also led to the development of several new detection concepts and experimental projects some of which are currently under construction. By its nature the field of ultra high energy cosmic rays is therefore highly interdisciplinary and borrows from astrophysics and cosmology via particle physics to experimental physics and observational astronomy. One main aspect of the school was to emphasize and take advantage of this interdisciplinarity. The lectures were grouped into subtopics and are reproduced in this volume in the following order: After a general introductory lecture on cosmic rays follow two contributions on experimental detection techniques followed by three lectures on acceleration in astrophysical objects. The next four contributions cover all major aspects of propagation and interactions of ultra high energy radiation including speculative issues such as new interactions.

Principles of Star Formation Peter Bodenheimer, 2011-07-10 Understanding star formation is one of the key fields in present day astrophysics. This book treats a wide variety of the physical processes involved as well as the main observational discoveries with key points being discussed in detail. The current star formation in our galaxy is emphasized because the most detailed observations are available for this case. The book presents a comparison of the various scenarios for star formation, discusses the basic physics underlying each one and follows in detail the history of a star from its initial state in the interstellar gas to its becoming a condensed object in equilibrium. Both theoretical and observational evidence to support the validity of the general evolutionary path are presented and methods for comparing the two are emphasized. The author is a recognized expert in calculations of the evolution of protostars, the structure and evolution of disks and stellar evolution in general. This book will be of value to graduate students in astronomy and astrophysics as well as to active researchers in the field.

The Molecular Astrophysics of Stars and Galaxies T. W. Hartquist, David A. Williams, 1998 This book provides a comprehensive survey of modern molecular astrophysics. It includes an introduction to molecular spectroscopy and then addresses the main areas of current molecular astrophysics including galaxy formation, star-forming regions, mass loss from young as well as highly evolved stars and supernovae, starburst galaxies, plus the tori and discs near the central engines of active galactic nuclei. All chapters have been written by invited authors who are acknowledged experts in their fields. The thorough editorial process has ensured a uniformly high standard of exposition and a coherent style. The book is unique in giving a detailed view of its wide-ranging subject. It will provide the standard introduction for research students in molecular astrophysics. The book will be read by research astronomers and astrophysicists who wish to broaden the basis of their

knowledge or are moving their activities into this burgeoning field It will enable chemists to learn the astrophysics most related to chemistry as well as instruct physicists about the molecular processes most important in astronomy

Gravity's Core Principles Harrison Stewart, AI, 2025-02-22 Gravity's Core Principles explores the pervasive influence of gravity a fundamental force shaping our universe It begins with familiar concepts like mass and distance then transitions to Einstein's General Relativity revealing gravity not as a simple attraction but as the curvature of spacetime caused by mass and energy Did you know that the first direct detection of gravitational waves in 2015 confirmed a key prediction of Einstein's theory Or that understanding gravity is crucial for accurately predicting the trajectories of interplanetary probes This book uniquely balances historical context with modern theories starting from early philosophical ideas about falling objects and progressing to sophisticated models used in astrophysics and cosmology today Accessible explanations and clear visualizations help demystify complex equations allowing motivated learners to grasp essential concepts The book progresses systematically first establishing Newtonian gravity as a foundation before delving into General Relativity gravitational lensing and black holes It concludes with discussions of ongoing research into gravitational waves and potential future discoveries like quantum gravity This textbook emphasizes both Newtonian and Einsteinian gravity providing a deep yet accessible understanding of gravitational physics
