Role Of Peptides In Neuronal Function:

The Role of Peptides in Neuronal Function Jeffery L. Barker, Thomas Graves Smith, 1980 **The Role of Peptides in Neuronal Function** Jeffery L. Barker, Thomas Graves Smith, 1980 **Neural Functions of the Delta-Opioid Receptor** Ying Xia, 2015-12-29 This book is the first to summarize the progress of research on neural functions of the the delta opioid receptor DOR to date This receptor a member of the opioid receptor family was traditionally thought to be primarily involved in pain modulation Recent new findings have shown its unique role in neuroprotection and many other functions Many scientists from a number of independent laboratories have now confirmed that DOR can provide neuroprotection against hypoxic ischemic injuries They have also found that it plays a role in a variety of physiological and pathophysiological events such as hypoxic encephalopathy epilepsy acupuncture Parkinson s disease etc by regulating ionic homeostasis glutamate transportation and signaling and balancing intracellular survival death signals The book will provide a comprehensive overview of the current state of DOR research and provide a blueprint for future directions **Biomedical Index to PHS-supported Research** , 1991 **Extrasynaptic neurotransmission as a way of modulating multiple neuronal functions** Francisco F. De-Miguel, Kjell Fuxe, Extrasynaptic transmission is a unifying term for a wide variety of cellular processes in which outside of synaptic terminals transmitter substances activate extrasynaptic receptors Whereas synaptic transmission immediately refers to a process occurring at nerve terminals in which the arrival of a presynaptic impulse evokes exocytosis followed by a postsynaptic response within a millisecond time scale extrasynaptic transmission has a wide diversity of ultrastructural and therefore mechanistic associated phenomena In comparison to synaptic extrasynaptic exocytosis may last for seconds or even minutes thus expanding the timing of neuronal signaling Extrasynaptic transmission has now been demonstrated in central and peripheral neurons of vertebrates and invertebrates and involves many different types of transmitter substances than include low molecular weight transmitters acetylcholine GABA glutamate ATP and biogenic amines and peptides substance P vasopressin and others It may occur when transmitters leak out from the synaptic cleft and activate extrasynaptic receptors in neighboring neurons or glial cells or when axonal varicosities dendrites or the somata release transmitters in the absence of postsynaptic counterparts The release mechanisms also vary from one neuron type to another and from one neuronal compartment to another In some cases clear vesicles are apposed to the resting plasma membrane as in presynaptic terminals In other cases transmitters are packed onto dense core vesicles that rest at a distance from the release sites In between there are multiple morphological combinations that point to complementary mechanisms in different compartments of the same neuron and some times even in the same compartment For example serotonergic varicosities may combine clear and dense core vesicles in stereotyped arrays This diversity adds complexity to the nervous system and raises many questions that are waiting for answers Extrasynaptic transmission may be the main source of transmitter molecules causing volume transmission however this still lacks direct demonstration From the

physiological point of view one may ask how does the neuronal firing pattern evokes synaptic or extrasynaptic transmitter release or what are the physiological effects of these modes of transmission From the behavioral point of view it becomes interesting to explore how circuits and therefore behaviors are modulated Some neurological dysfunctions may also be related to deficiencies in extrasynaptic transmission however again direct studies are still lacking Developmental and evolutionary biologists may also find the topic inspiring Extrasynaptic transmission not only expands our view about how the nervous system works but also requires a change in the way we plan our research New technological and computational tools are now being applied to analyze intracellular and extracellular transmitter mobilizations or long term changes of neuronal circuits New definitions and mechanisms may become visible In the meanwhile this seems to be a good moment for a first common effort to analyze and discuss extrasynaptic transmission in different systems and from different perspectives

The Neuronal Functions of EF-hand Ca(2+)-binding Proteins 2nd Edition Michael R. Kreutz, José R.

Naranjo, Karl-Wilhelm Koch, Beat Schwaller, 2016-11-01 Ca²⁺ signaling in neurons is characterized by highly restricted and dynamic gradients called Ca²⁺ waves spikes transients and puffs depending upon their corresponding spatial and temporal features Based on this strict segmentation the Ca²⁺ ion provides a versatile basis for complex signaling in neuronal subcompartments with a spatial resolution of micro and nanodomains The multitude of Ca²⁺ regulated processes requires specialized downstream processing machinery translating the Ca²⁺ signal into alterations of cellular processes The broad range of different Ca²⁺ triggered phenomena in neurons ranging from neurotransmission to gene expression is reflected by the existence of a multitude of different Ca²⁺ binding proteins CaBPs from which numerous belong to the EF hand super family EF hand proteins can be subdivided into Ca²⁺ buffer and Ca²⁺ sensor proteins Whereas the first group has a very high affinity for Ca²⁺ exhibits little conformational change in the Ca²⁺ bound state and is thought to mainly chelate Ca²⁺ the second group has a lower affinity for Ca²⁺ and shows considerable conformational changes upon Ca²⁺ binding which usually triggers a target interaction Neuronal calcium sensor NCS proteins and the related Caldendrin CaBP Calneuron nCaBPs proteins are members of this latter group They resemble the structure of their common ancestor Calmodulin CaM with four EF hand Ca²⁺ binding motifs of which not all are functional However despite their structural homology with CaM NCS as well as nCaBPs are quite diverse in amino acid sequence It is therefore surprising that relatively few binding partners have been identified that are not CaM targets and this raises the question of the specificity and function of these interactions In terms of function binding of NCS and nCaBP has frequently different consequences than binding of CaM which substantially increases the versatility of the Ca²⁺ tool kit The general idea of this special issue is to provide an overview on the function of neuronal EF hand calcium binding proteins in health and disease But we will not just provide a mere collection of articles to stress the function of each protein The issue will mainly deal with emerging concepts on Ca²⁺ signaling buffering mediated by EF hand Ca²⁺ binding proteins This includes questions like features that define the functional role of a EF hand calcium sensor in

neurons the conditions that make physiological relevance of a given interaction of a CaBP with its target plausible the emerging synaptic role of these proteins and mounting evidence for their role in the regulation of protein trafficking Structural aspects and biophysical studies will be covered Another aspect will be the role of CaBPs in brain disease states This aspect includes studies showing that CaBPs are targets of drugs in clinical use studies showing that expression levels of calcium binding proteins are frequently altered in brain disease states as well as reports on mutations in EF hand calcium sensors linked to human disease **Biomedical Index to PHS-supported Research: pt.
