*A Systems Description of Flow Through Porous Media* Jan Dirk Jansen,2013-05-23 This text forms part of material taught during a course in advanced reservoir simulation at Delft University of Technology over the past 10 years The contents have also been presented at various short courses for industrial and academic researchers interested in background knowledge needed to perform research in the area of closed loop reservoir management also known as smart fields related to e g model based production optimization data assimilation or history matching model reduction or upscaling techniques Each of these topics has connections to system theoretical concepts The introductory part of the course i e the systems description of flow through porous media forms the topic of this brief monograph The main objective is to present the classic reservoir simulation equations in a notation that facilitates the use of concepts from the systems and control literature Although the theory is limited to the relatively simple situation of horizontal two phase oil water flow it covers several typical aspects of porous media flow The first chapter gives a brief review of the basic equations to represent single phase and two phase flow It discusses the governing partial differential equations their physical interpretation spatial discretization with finite differences and the treatment of wells It contains well known theory and is primarily meant to form a basis for the next chapter where the equations will be reformulated in terms of systems and control notation The second chapter develops representations in state space notation of the porous media flow equations The systematic use of matrix partitioning to describe the different types of inputs leads to a description in terms of nonlinear ordinary differential and

algebraic equations with state dependent system input output and direct throughput matrices Other topics include generalized state space representations linearization elimination of prescribed pressures the tracing of stream lines lift tables computational aspects and the derivation of an energy balance for porous media flow The third chapter first treats the analytical solution of linear systems of ordinary differential equations for single phase flow Next it moves on to the numerical solution of the two phase flow equations covering various aspects like implicit explicit or mixed IMPES time discretizations and associated stability issues Newton Raphson iteration streamline simulation automatic time stepping and other computational aspects The chapter concludes with simple numerical examples to illustrate these and other aspects such as mobility effects well constraint switching time stepping statistics and system energy accounting The contents of this brief should be of value to students and researchers interested in the application of systems and control concepts to oil and gas reservoir simulation and other applications of subsurface flow simulation such as CO<sub>2</sub> storage geothermal energy or groundwater remediation
