Henry, 2008 This book aims to describe some of the important recent developments in plant genotyping It is based upon a second workshop held recently to review progress in this area Recent developments focus on high throughput methods and generally target single nucleotide polymorphism SNP discovery and analysis The topics covered include SNP discovery in plants SNPs and their use in maize rare SNP discovery with endonucleases sequence polymorphisms in the flanking regions of microsatellite markers SNP discovery by ecotilling using capillary electrophoresis genotyping by allele specific PCR the MassARRAY system for plant genomics mutation screening nanotechnology the future of cost effective plant genotyping functionally associated molecular genetic markers for temperate pasture plant improvement genotyping for rice eating qualities towards universal loci for plant genotyping DNA banks as a resource for SNP genotyping DNA extraction from plant tissue future prospects for plant genotyping Applications and Systematics of Bacillus and Relatives Roger Berkeley, Marc Heyndrickx, Niall Logan, Paul De Vos, 2008-04-30 Inspired by the pace of change in the taxonomy of the aerobic endospore forming bacteria the Bacillus 2000 symposium on which this book is based was held in Bruges Belgium in August 2000 and was supported by the Federation of European Microbiological Societies the Belgian Society for Microbiology and several commercial sponsors Bringing taxonomists interested in Bacillus and its relatives together with people who work with these organisms in medicine agriculture and industry allowed those attending to appreciate the overlaps and interactions of their areas of expertise in the absence of any comprehensive treatment of the current systematics of the group The meeting was a great success and has resulted in the production of these proceedings Applications and Systematics of Bacillus and Relatives providing an up to date and comprehensive treatise on the classification identification and applications of the aerobic endospore forming bacteria it is an essential reference for all microbiologists interested in these organisms Valuable reference work for all those interested in the systematics of Bacillus and its relatives Produced in response to the successful Bacillus 2000 meeting in Bruges and was supported by the

Federation of European Microbiological Societies the Belgian Society for Microbiology and several commercial sponsors Of use to those working in fields as diverse as medicine agriculture food and industry Comprehensive and up to date analysis of the systematics of these organisms Includes the application of sophisticated chemotaxonomic and genetic characterization Molecular Biology of Woody Plants S.M. Jain, S.C. Minocha, 2013-04-17 Woody plants constitute an artificial and heterogeneous group of plants that share some common phenotypic characteristics but otherwise have no strong evolutionary relationships nor do they share a common habitat They are a primary source of fiber and timber and also include many edible fruit species Their unique phenotypic behavior includes a perennial habit associated with extensive secondary growth Additional characteristics of woody plants include developmental juvenility and maturity with respect to growth habit flowering time and morphogenetic response in tissue cultures environmental control of bud dormancy and flowering cycles variable tolerance to abiotic stresses wounding and pathogens and long distance transport of water and nutrients Woody plants particularly tree species have been the focus of numerous physiological studies to understand their specialized functions however only recently have they become the target of molecular studies Recent advances in our understanding of signal transduction pathways for environmental responses in herbaceous plants including the identification and cloning of genes for proteins involved in signal transduction should provide useful leads to undertake parallel studies with woody plants Molecular mapping techniques coupled with the availability of cloned genes from herbaceous plants should provide shortcuts to cloning relevant genes from woody plants The unique phenotypes of these plants can then be targeted for improvement through genetic engineering In this book we present a broad coverage of various aspects of plant molecular biology that are relevant to the improvement of woody plant Plant Molecular Breeding H. John Newbury, 2009-02-18 The last few years have seen an explosion of new information andresources in the areas of plant molecular genetics and genomics Asa result of developments such as high throughput sequencing we nowhave huge amounts of information available on plant genes But howdoes this help people charged with the task of improving cropspecies to create products with altered functions or improved characteristics. This volume considers ways in which the new information resources and technology can be exploited by the plant breeder Examples in current use will be quoted wherever possible

DNA-based markers in plants R.L. Phillips,Indra K. Vasil,2012-12-06 The double helix architecture of DNA was elucidated in 1953 Twenty years later in 1973 the discovery of restriction enzymes helped to create recombinant DNA molecules in vitro The implications of these powerful and novel methods of molecular biology and their potential in the genetic manipulation and improvement of microbes plants and animals became increasingly evident and led to the birth of modern biotechnology The first transgenic plants in which a bacterial gene had been stably integrated were produced in 1983 and by 1993 transgenic plants had been produced in all major crop species including the cereals and the legumes These remarkable achievements have resulted in the production of crops that are resistant to potent but environmentally safe herbicides or to viral pathogens and insect pests In other instances genes have been introduced that delay fruit ripening or increase starch content or cause male sterility Most of these manipulations are based on the introduction of a single gene generally of bacterial origin that regulates an important monogenic trait into the crop of choice Many of the engineered crops are now under field trials and are expected to be commercially produced within the next few years The early successes in plant biotechnology led to the realization that further molecular improvement of plants will require a thorough understanding of the molecular basis of plant development and the identification and character ization of genes that regulate agronomically important multi genic traits
