

Advanced topic: What makes a fair election?

Ellenberg's book goes further:

- Ellenberg explains parts of a mathematical theory of elections created by the French mathematician Condorcet in the late 1700s.

Condorcet started with an axiom:

- If the majority of voters prefer candidate A to candidate B, then candidate B cannot be the people's choice.

Condorcet then explored how to create a voting system that would satisfy this axiom...

- He tried but failed to find a voting system that would work...
- and in 1951, the mathematician Kenneth Arrow proved that even with a weaker set of axioms, there would be paradoxes.

Conclusion: There Is No Such Thing as Public Opinion

Mathematical Theory Of Elections:

The Mathematical Theory of Elections Joseph Malkevitch, 1985 Mathematical Theory of Democracy Andranik Tangian, 2013-07-31 The mathematical theory of democracy deals with selection of representatives who make decisions on behalf of the whole society In this book the notion of representativeness is operationalized with the index of popularity the average percentage of the population whose opinion is represented on a number of issues and the index of universality the frequency of cases when the opinion of a majority is represented These indices are applied to evaluate and study the properties of single representatives e g president and representative bodies e g parliament magistrate cabinet jury coalition To bridge representative and direct democracy an election method is proposed that is based not on voting but on indexing candidates with respect to the electorate s political profile In addition societal and non societal applications are considered

The Mathematical Theory of Elections Joseph Malkevitch, Gary W. Froelich, High School Mathematics and Its Applications Project (HiMAP), Consortium for Mathematics and Its Applications (U.S.), 1989 *The Theory of Committees and Elections* Duncan Black, 2012-12-06 THIS book or some related work has occupied me spasmodically over rather a long period in fact ever since I listened to the class lectures of Professor A K White on the possibility of forming a pure science of Politics Mter an earlier version of Part I had failed to obtain publication in 1947 some chapters appeared as articles and I am obliged to the editors of the journals mentioned below for permission to reprint this material sometimes in a modified form When I first attempted publication I was unacquainted with the earlier history of the theory and indeed did not even know that it had a history and the later additions to the book have largely been by way of writing the present Part II This historical section does not include the important recent work Social Ochoice and Individual Values 1951 of Professor Kenneth J Arrow but it does include all the mathematical work on committees and elections appearing before the middle of this century which has come to my notice although the last item in it is dated 1907 No doubt there is much important material which I have failed to see The theorizing of the book grew out of a reading of the English political philosophers and of the Italian writers on Public Finance At a very early stage I was helped to find the general lines of development by discussion with my colleague Professor Ronald H The Theory of Committees and Elections by Duncan Black and Committee Decisions with Complementary Valuation by Duncan Black and R.A. Newing Iain S. McLean, Alistair McMillan, Burt L. Monroe, 2013-03-09 R H Coase Duncan Black was a close and dear friend A man of great simplicity un worldly modest diffident with no pretensions he was devoted to scholarship In his single minded search for the truth he is an example to us all Black s first degree at the University of Glasgow was in mathematics and physics Mathematics as taught at Glasgow seems to have been designed for engineers and did not excite him and he switched to economics which he found more congenial But it was not in a lecture in economics but in one on politics that he found his star One lecturer A K White discussed the possibility of constructing a pure science of politics This question caught his imagination perhaps because of his earlier training in physics and it came to

absorb his thoughts for the rest of his life But almost certainly nothing would have come of it were it not for his appointment to the newly formed Dundee School of Economics where the rest of the teaching staff came from the London School of Economics At Glasgow economics as in the time of Adam Smith was linked with moral philosophy At Dundee Black was introduced to the analytical x The Theory o Committees and Elections approach dominant at the London School of Economics This gave him the approach he used in his attempt to construct a pure science of politics *Voting Made Easy* Lewis Lum, David C. Kurtz, 1975* *Mathematical Analyses of Decisions, Voting and Games* Michael A. Jones, David McCune, Jennifer M. Wilson, 2024-03-25 This volume contains the proceedings of the virtual AMS Special Session on Mathematics of Decisions Elections and Games held on April 8 2022 Decision theory voting theory and game theory are three related areas of mathematics that involve making optimal decisions in different contexts While these three areas are distinct much of the recent research in these fields borrows techniques from other branches of mathematics such as algebra combinatorics convex geometry logic representation theory etc The papers in this volume demonstrate how the mathematics of decisions elections and games can be used to analyze problems from the social sciences *The Mathematics of Decisions, Elections, and Games* Karl-Dieter Crisman, Michael A. Jones, 2014-08-29 This volume contains the proceedings of two AMS Special Sessions on The Mathematics of Decisions Elections and Games held January 4 2012 in Boston MA and January 11 12 2013 in San Diego CA Decision theory voting theory and game theory are three intertwined areas of mathematics that involve making optimal decisions under different contexts Although these areas include their own mathematical results much of the recent research in these areas involves developing and applying new perspectives from their intersection with other branches of mathematics such as algebra representation theory combinatorics convex geometry dynamical systems etc The papers in this volume highlight and exploit the mathematical structure of decisions elections and games to model and to analyze problems from the social sciences **Making Democracy Fair: The mathematics of voting and apportionment** Michael de Villiers, Leslie Johnson Nielsen, 2012-09-23 How do you know if an election is fair Or if the result truly represents the choice of the people In Making Democracy Fair students use elementary mathematical methods to explore different kinds of ballots election decision procedures and apportionment methods In the first half of the book students are introduced to a variety of alternatives to the winner take all strategy used in most elections Determining which strategy is fairest is usually a very difficult question to answer and many times the strategy chosen determines the winner In the second part of the book students investigate different methods of apportionment How many representatives from each state will there be in the United States House of Representatives How do countries using a proportional representation decide on the number of representatives from each political party to be seated in their government bodies *Social Choice and the Mathematics of Manipulation* Alan D. Taylor, 2005-05-09 Honesty in voting it turns out is not always the best policy Indeed in the early 1970s Allan Gibbard and Mark Satterthwaite building on the seminal work of Nobel laureate Kenneth Arrow proved that with three

or more alternatives there is no reasonable voting system that is non manipulable voters will always have an opportunity to benefit by submitting a disingenuous ballot The ensuing decades produced a number of theorems of striking mathematical naturalness that dealt with the manipulability of voting systems This 2005 book presents many of these results from the last quarter of the twentieth century especially the contributions of economists and philosophers from a mathematical point of view with many new proofs The presentation is almost completely self contained and requires no prerequisites except a willingness to follow rigorous mathematical arguments Mathematics students as well as mathematicians political scientists economists and philosophers will learn why it is impossible to devise a completely unmanipulable voting system
