**Mathematical Theory of Electrophoresis** V.G. Babskii, V.I. Yudovich, 1989-04-30 The development of contemporary molecular biology with its growing tendency toward in depth study of the mechanisms of biological processes structure function and identification of biopolymers requires application of accurate physicochemical methods Electrophoresis occupies a key position among such methods A wide range of phenomena fall under the designation of electrophoresis in the literature at the present time One common characteristic of all such phenomena is transport by an electric field of a substance whose particles take on a net charge as a result of interaction with the solution The most important mechanisms for charge generation are dissociation of the substance into ions in solution and formation of electrical double layers with uncompensated charges on particles of dispersed medium in the liquid As applied to the problem of separation purification and analysis of cells cell organelles and biopolymers there is a broad classification of electrophoretic methods primarily according to the methodological characteristics of the process the types of supporting media etc An extensive literature describes the use of these methods for the investigation of different systems A number of papers are theoretical in nature Thus the microscopic theory has been developed rather completely 13 by considering electrophoresis within the framework of electrokinetic phenomena based on the concept of the electrical double layer
