Semantics-Oriented Natural Language Processing

Vladimir Fomichov A.,2009-12-01 Gluecklich die wissen dass hinter allen Sprachen das Unsaegliche steht Those are happy who know that behind all languages there is something unsaid Rainer Maria Rilke This book shows in a new way that a solution to a fundamental problem from one scienti c eld can help to find the solutions to important problems emerged in several other elds of science and technology In modern science the term Natural Language denotes the collection of all such languages that every language is used as a primary means of communication by people belonging to any country or any region So Natural Language NL includes in particular the English Russian and German languages The applied computer systems processing natural language printed or written texts NL texts or oral speech with respect to the fact that the words are associated with some meanings are called semantics oriented natural language processing s tems NLPs On one hand this book is a snapshot of the current stage of a research p gram started many years ago and called Integral Formal Semantics IFS of NL The goal of this program has been to develop the formal models and methods he ing to overcome the dif culties of logical character associated with the engineering of semantics oriented NLPs The designers of such systems of arbitrary kinds will find in this book the formal means and algorithms being of great help in their work

The Alternative Mathematical Model of Linguistic Semantics and Pragmatics

Vilém Novák,2013-06-29 In opposition to the classical set theory of natural language Nov k s highly original monograph offers a theory based on alternative and fuzzy sets This new approach is firmly grounded in semantics and pragmatics and accounts for the vagueness inherent in natural language filling a large gap in our current knowledge The theory will foster fruitful debate among researchers in linguistics and artificial intelligence

Mathematical Models for Speech Technology Stephen Levinson,2005-05-13 Mathematical Models of Spoken Language presents the motivations for intuitions behind and basic mathematical models of natural spoken language communication A comprehensive overview is given of all aspects of the problem from the physics of speech production through the hierarchy of linguistic structure and ending with some observations on language and mind The author comprehensively explores the argument that these modern technologies are actually the most extensive compilations of linguistic knowledge available Throughout the book the emphasis is on placing all the material in a mathematically coherent and computationally tractable framework that captures linguistic structure It presents material that appears nowhere else and gives a unification of formalisms and perspectives used by linguists and engineers Its unique features include a coherent nomenclature that emphasizes the deep connections amongst the diverse mathematical models and explores the methods by means of which they capture linguistic structure This contrasts with some of the superficial similarities described in the existing literature the historical background and origins of the theories and models the connections to related disciplines e g artificial intelligence automata theory and information

theory an elucidation of the current debates and their intellectual origins many important little known results and some original proofs of fundamental results e g a geometric interpretation of parameter estimation techniques for stochastic models and finally the author s own unique perspectives on the future of this discipline There is a vast literature on Speech Recognition and Synthesis however this book is unlike any other in the field Although it appears to be a rapidly advancing field the fundamentals have not changed in decades Most of the results are presented in journals from which it is difficult to integrate and evaluate all of these recent ideas Some of the fundamentals have been collected into textbooks which give detailed descriptions of the techniques but no motivation or perspective The linguistic texts are mostly descriptive and pictorial lacking the mathematical and computational aspects This book strikes a useful balance by covering a wide range of ideas in a common framework It provides all the basic algorithms and computational techniques and an analysis and perspective which allows one to intelligently read the latest literature and understand state of the art techniques as they evolve

Linguistic Geometry Boris Stilman,2012-12-06 Linguistic Geometry From Search to Construction is the first book of its kind Linguistic Geometry LG is an approach to the construction of mathematical models for large scale multi agent systems A number of such systems including air space combat robotic manufacturing software re engineering and Internet cyberwar can be modeled as abstract board games These are games with moves that can be represented by the movement of abstract pieces over locations on an abstract board The purpose of LG is to provide strategies to guide the games participants to their goals Traditionally discovering such strategies required searches in giant game trees These searches are often beyond the capacity of modern and even conceivable future computers LG dramatically reduces the size of the search trees making the problems computationally tractable LG provides a formalization and abstraction of search heuristics used by advanced experts including chess grandmasters Essentially these heuristics replace search with the construction of strategies To formalize the heuristics LG employs the theory of formal languages i e formal linguistics as well as certain geometric structures over an abstract board The new formal strategies solve problems from different domains far beyond the areas envisioned by the experts For a number of these domains Linguistic Geometry yields optimal solutions

Foundations of Mathematical Modelling for Engineering Problem Solving Parikshit Narendra Mahalle,Nancy Ambritta P.,Sachin R. Sakhare,Atul P. Kulkarni,2023-01-10 This book aims at improving the mathematical modelling skills of users by enhancing the ability to understand connect apply and use the mathematical concepts to the problem at hand This book provides the readers with an in depth knowledge of the various categories classes of research problems that professionals researchers and students might encounter following which the applications of appropriate mathematical models is explained with the help of case studies The book is targeted at academicians researchers students and professionals who belong to all engineering disciplines

Mathematics of Language

Alexis Manaster-Ramer, 1987-01-01 By mathematics of language is meant the mathematical properties that may under certain assumptions about modeling be attributed to human languages and related symbolic systems as well as the increasingly active and autonomous scholarly discipline that studies such things More specifically the use of techniques developed in a variety of pure and applied mathematics including logic and the theory of computation in the discovery and articulation of insights into the structure of language Some of the contributions to this volume deal primarily with foundational issues others with specific models and theoretical issues A few are concerned with semantics but most focus on syntax The papers in this volume reveal applications of the several fields of the theory of computation formal languages automata complexity formal logic topology set theory graph theory and statistics The book also shows a keen interest in developing mathematical models that are especially suited to natural languages

Classification and Modeling with Linguistic Information

Granules Hisao Ishibuchi, Tomoharu Nakashima, Manabu Nii, 2004-11-19 Many approaches have already been proposed for classification and modeling in the literature These approaches are usually based on mathematical models Computer systems can easily handle mathematical models even when they are complicated and nonlinear e g neural networks On the other hand it is not always easy for human users to intuitively understand mathematical models even when they are simple and linear This is because human information processing is based mainly on linguistic knowledge while computer systems are designed to handle symbolic and numerical information A large part of our daily communication is based on words We learn from various media such as books newspapers magazines TV and the Internet through words We also communicate with others through words While words play a central role in human information processing linguistic models are not often used in the fields of classification and modeling If there is no goal other than the maximization of accuracy in classification and modeling mathematical models may always be preferred to linguistic models On the other hand linguistic models may be chosen if emphasis is placed on interpretability
