Algebraic Complexity Theory Peter Bürgisser,Michael Clausen,Mohammad A. Shokrollahi,2013-03-14 The algorithmic solution of problems has always been one of the major concerns of mathematics For a long time such solutions were based on an intuitive notion of algorithm It is only in this century that metamathematical problems have led to the intensive search for a precise and sufficiently general formalization of the notions of computability and algorithm In the 1930s a number of quite different concepts for this purpose

were proposed such as Turing machines WHILE programs recursive functions Markov algorithms and Thue systems All these concepts turned out to be equivalent a fact summarized in Church's thesis which says that the resulting definitions form an adequate formalization of the intuitive notion of computability This had and continues to have an enormous effect First of all with these notions it has been possible to prove that various problems are algorithmically unsolvable Among of group these undecidable problems are the halting problem the word problem theory the Post correspondence problem and Hilbert's tenth problem Secondly concepts like Turing machines and WHILE programs had a strong influence on the development of the first computers and programming languages In the era of digital computers the question of finding efficient solutions to algorithmically solvable problems has become increasingly important In addition the fact that some problems can be solved very efficiently while others seem to defy all attempts to find an efficient solution has called for a deeper understanding of the intrinsic computational difficulty of problems

Scientific and Technical Aerospace Reports, 1984-04 Control Systems Theory and Applications for Linear Repetitive Processes Eric Rogers, Krzysztof Galkowski, David H. Owens, 2007-07-11 After motivating examples this monograph gives substantial new results on the analysis and control of linear repetitive processes These include further applications of the abstract model based stability theory which in particular shows the critical importance to the dynamics developed of the structure of the initial conditions at the start of each new pass the development of stability tests and performance bounds in terms of so called 1D and 2D Lyapunov equations It presents the development of a major bank of results on the structure and design of control laws including the case when there is uncertainty in the process model description together with numerically reliable computational algorithms Finally the application of some of these results in the area of iterative learning control is treated including experimental results from a chain conveyor system and a gantry robot system

Systems Theory with Engineering Applications Mihail Voicu, 2021-09-09 This book presents in a rigorous and comprehensible way the mathematical description and analysis of linear dynamic systems and the controllability and observability of linear dynamic systems It also details the stability of linear dynamic systems automatic control systems and nonlinear dynamic systems and the optimal control of dynamic systems The treatment is both systemic and synthetic achieving rigorous and applicative solutions and is illustrated with engineering examples The book will appeal to scientists working in the practice of systems theory engineering automatic control computer science electrical engineering electronics and applied mathematics in biology and economics as well as scientists working in education research design and industry

Differential Operators and Related Topics V.M. Adamyan, Israel Gohberg, Myroslav L. Gorbachuk, Valentina I. Gorbachuka, Marinus A. Kaashoek, G. Popov, H. Langer, 2012-12-06 The present book is the first of the two volume Proceedings of the Mark Krein International Conference on Operator Theory and Applications This conference which was dedicated to the 90th Anniversary of the prominent mathematician Mark Krein was held in Odessa Ukraine from 18-22 August 1997 The conference focused

on the main ideas, methods, results, and achievements of M. G. Krein. This first volume is devoted to the theory of differential operators and related topics. It opens with a description of the conference, biographical material, and a number of survey papers about the work of M. G. Krein. The main part of the book consists of original research papers presenting the state of the art in the area of differential operators. The second volume of these proceedings, entitled *Operator Theory and Related Topics*, concerns the other aspects of the conference. The two volumes will be of interest to a wide range of readership in pure and applied mathematics, physics, and engineering sciences.
