Self-Organization in the Nervous System Yan M. Yufik, Biswa Sengupta, Karl Friston, 2017-11-30 This special issue reviews state of the art approaches to the biophysical roots of cognition These approaches appeal to the notion that cognitive capacities serve to optimize responses to changing external conditions Crucially this optimisation rests on the ability to predict changes in the environment thus allowing organisms to respond pre emptively to changes before their onset The biophysical mechanisms that underwrite these cognitive capacities remain largely unknown although a number of hypotheses has been advanced in systems neuroscience biophysics and other disciplines These hypotheses converge on the intersection of thermodynamic and information theoretic formulations of self organization in the brain The latter perspective emerged when Shannon s theory of message transmission in communication systems was used to characterise message passing between neurons In its subsequent incarnations the information theory approach has been integrated into computational neuroscience and the Bayesian brain framework The thermodynamic formulation rests on a view of the brain as an aggregation of stochastic microprocessors neurons with subsequent appeal to the constructs of statistical mechanics and thermodynamics In particular the use of ensemble dynamics to elucidate the relationship between micro scale parameters and those of the macro scale aggregation the brain In general the thermodynamic approach treats the brain as a dissipative system and seeks to represent the development and functioning of cognitive mechanisms as collective capacities that emerge in the course of self organization Its explicanda include energy efficiency enabling progressively more complex cognitive operations such as long term prediction and anticipatory planning A cardinal example of the Bayesian brain approach is the free energy principle that explains self organizing dynamics in the brain in terms of its predictive capabilities and selective sampling of sensory inputs that optimise variational free energy as a proxy for Bayesian model evidence An example of thermodynamically grounded proposals in this issue associates self organization with phase transitions in neuronal state spaces resulting in the formation of bounded neuronal assemblies neuronal packets This special issue seeks a discourse between thermodynamic and informational formulations of the self organising and self evidencing brain For example could minimization of thermodynamic free energy during the formation of neuronal packets underlie minimization of variational free energy

Learning As Self-organization Karl H. Pribram, Joseph S. King, 2013-06-17 A year before his death B F Skinner wrote that There are two unavoidable gaps in any behavioral account one between the stimulating action of the environment and the response of the organism and one between consequences and the resulting change in behavior Only brain science can fill those gaps In doing so it completes the account it does not give a different account of the same thing This declaration ended the epoch of radical behaviorism to the extent that it was based on the doctrine of the empty organism the doctrine that a behavioral science must be constructed purely on its own level of investigation However Skinner

was not completely correct in his assessment Brain science on its own can no more fill the gaps than can single level behavioral science It is the relation between data and formulations developed in the brain and the behavioral sciences that is needed This volume is the result of The Fourth Appalachian Conference on Behavioral Neurodynamics the first three of which were aimed at filling Skinner s first gap Taking the series in a new direction the aim of the fourth and subsequent conferences is to explore the second of the gaps in the behavioral account noted by Skinner The aim of this conference was to explore the aphorism The motivation for learning is self organization In keeping with this aim and in the spirit of previous events this conference s mission was to acquaint scientists working in one discipline with the work going on in other disciplines that is relevant to both As a result it brought together those who are making advances on the behavioral level mainly working in the tradition of operant conditioning and those working with brains mainly amygdala hippocampus and far frontal cortex

Optimality in Biological and Artificial Networks? Daniel S. Levine, Wesley R. Elsberry, 2013-06-17 This book is the third in a series based on conferences sponsored by the Metroplex Institute for Neural Dynamics an interdisciplinary organization of neural network professionals in academia and industry The topics selected are of broad interest to both those interested in designing machines to perform intelligent functions and those interested in studying how these functions are actually performed by living organisms and generate discussion of basic and controversial issues in the study of mind The topic of optimality was chosen because it has provoked considerable discussion and controversy in many different academic fields There are several aspects to the issue of optimality First is it true that actual behavior and cognitive functions of living animals including humans can be considered as optimal in some sense Second what is the utility function for biological organisms if any and can it be described mathematically Rather than organize the chapters on a biological versus artificial basis or by what stance they took on optimality it seemed more natural to organize them either by what level of questions they posed or by what intelligent functions they dealt with The book begins with some general frameworks for discussing optimality or the lack of it in biological or artificial systems The next set of chapters deals with some general mathematical and computational theories that help to clarify what the notion of optimality might entail in specific classes of networks The final section deals with optimality in the context of many different high level issues including exploring one s environment understanding mental illness linguistic communication and social organization The diversity of topics covered in this book is designed to stimulate interdisciplinary thinking and speculation about deep problems in intelligent system organization

The Origins of Life Anna-Teresa Tymieniecka, 2013-03-09 Life appears ungraspable yet its understanding lies at the heart of current preoccupations In our attempt to understand life through its origins the ambition of the present collection is to unravel the network of the origin of the various spheres of sense that carry it onwards The primogenital matrix of generation Tymieniecka elaborated as the fulcrum of this collection elucidates the main riddles of the scientific philosophical controversies concerning the status of various spheres that seek to make sense of life

Hypnosis and Imagination

Robert Kunzendorf, Nicholas Spanos, Benjamin Wallace, 2018-10-26 The book's first three chapters by Sheehan and Robertson Wagstaff Council Kirsch and Grant conclude that three different factors turn imagination into hypnosis The next three chapters by Lynn Neufeld Green Rhue and Sandberg Rader Kunzendorf and Carrabino and Barrett explore the hypnotic and the clinical significance of absorption in imagination Three subsequent chapters by Coe Gwynn and Spanos and Gorassini examine the role of compliance and imagination in various hypnotic phenomena Pursuing the possibility that some hypnotic hallucinations are experienced differently from normal images the following two chapters by Perlini Spanos and Jones and Kunzendorf and Boisvert focus on negative hallucinating which reportedly blocks out perceptual reality The remaining three chapters by Wallace and Turosky Crawford and Persinger pursue other physiological differences and possible physiological connections between hypnosis and imagination

Aligning Perceptual and Conceptual Information for Cognitive Contextual System Development: Emerging Research and Opportunities Kuvich, Gary, 2017-09-13 The rise of technology has led to rapid developments in robotic intelligence and its various applications The success or failure of these systems is linked closely with effective perception and cognition models Aligning Perceptual and Conceptual Information for Cognitive Contextual System Development Emerging Research and Opportunities is an innovative source of academic content on approaches to cognitive and perceptual systems development in artificial intelligence Including a range of relevant topics such as object processing implicit symbols and knowledge representation this book is ideally designed for engineers academics practitioners and students interested in perceptual and conceptual interpretation in artificial intelligence

Computational Neuroscience James M. Bower, 2013-06-29 This volume includes papers presented at the Fifth Annual Computational Neuroscience meeting CNS 96 held in Boston Massachusetts July 14-17 1996 This collection includes 148 of the 234 papers presented at the meeting Acceptance for meeting presentation was based on the peer review of preliminary papers originally submitted in May of 1996 The papers in this volume represent final versions of this work submitted in January of 1997 As represented by this volume computational neuroscience continues to expand in quality size and breadth of focus as increasing numbers of neuroscientists are taking a computational approach to understanding nervous system function Defining computational neuroscience as the exploration of how brains compute it is clear that there is almost no subject or area of modern neuroscience research that is not appropriate for computational studies The CNS meetings as well as this volume reflect this scope and diversity
