Abstract: Intelligent energy management in renewable-based power distribution applications, such as microgrids, smart grids, smart buildings, and EV systems, is becoming increasingly important in the context of the transition toward the decentralization, digitalization, and decarbonization of energy networks. Arguably, many challenges can be overcome, and benefits leveraged, in this transition by the adoption of intelligent autonomous computer-based decision-making through the introduction of smart technologies, specifically artificial intelligence. Unlike other numerical or soft computing optimization methods, the control based on artificial intelligence allows the decentralized power units to collaborate in making the best decision of fulfilling the administrator's needs, rather than only a primitive decentralization based only on the division of tasks. Amongst the smart approaches, reinforcement learning stands as the most relevant and successful, particularly in power distribution management applications. The reason is it does not need an accurate model for attaining an optimized solution regarding the interaction with the environment. Accordingly, there is an ongoing need to accomplish a clear, up-to-date, vision of the development level, especially with the lack of recent comprehensive detailed reviews of this vitally important research field. Therefore, this paper fulfills the need and presents a comprehensive review of the state-of-the-art successful and distinguished intelligent control strategies-based RL in optimizing the management of power flow and distribution. Wherein extensive importance is given to the classification of the literature on emerging strategies, the proposals based on RL multiagent, and the multiagent primary secondary control of managing power flow in micro and smart grids, particularly the energy storage. As a result, 126 of the most relevant, recent, and non-incremental have been reviewed and put into relevant categories. Furthermore, salient features have been identified of the major positive and negative, of each selection.

1. Introduction

The control of renewable energy in modern power distribution applications, such as microgrids, smart grids, smart buildings, and electric vehicles (EVs) applications, is experiencing a large, fundamental transition due to several technological advances and environmental considerations. For instance, the world is gearing toward the enhancement of the introduction of renewable energy and transportation based on either EVs or alternative fuels, due to their economic, technical, and environmental advantages [1]. However, the current global electricity and alternative fuel generation is still a mixed fuel, with the supremacy of fossil fuel remaining in many regions of the world. In fact, both trends are fundamentally related since the use of renewable energy in charging EVs or generating alternative fuels such as hydrogen would significantly reduce greenhouse gas emissions [2]. Optimal power distribution control is the most prominent challenge in enhancing the penetration and sustainability of renewable energy and reducing the use of fossil fuels, due

The Power of Reinforcement Stephen Ray Flora, 2012-02-01 2004 CHOICE Outstanding Academic Title According to Stephen Ray Flora reinforcement is a very powerful tool for improving the human condition despite often being dismissed as regarding people as less than human and as overly simplistic This book addresses and defends the use of reinforcement principles against a wide variety of attacks Countering the myths criticisms and misrepresentations of reinforcement including false claims that reinforcement is rat psychology the author shows that building reinforcement theory on basic laboratory research is a strength not a weakness and allows unlimited applications to human situations as it promotes well being and productivity Also examined are reinforcement contingencies planned or accidental as they shape behavioral patterns and repertoires in a positive way

Renewable Energy Policy Convergence in the EU David Jacobs, 2016-03-23 This book examines the coordination of renewable energy policies in the European Union using an innovative theoretical approach to explain national policy making David Jacobs asks why are national support instruments for electricity from renewable energy sources converging even though the harmonisation of these frameworks at the European level has failed Which causal mechanisms lead to cross national policy similarities And what are the implications for policy coordination in the EU The author traces the evolution of feed in tariffs the most successful and most widely used support mechanism for renewable electricity in Germany Spain and France He reveals increasing cross national policy similarities in feed in tariff design despite the failure of harmonizing instruments at the European level He explains these increasing policy similarities by applying policy convergence theory Policy convergence can occur voluntarily based on transnational communication regulatory competition and technological innovations and these findings have important implications for European policy steering The key to this book is the interrelation of an innovative theoretical concept coordination of policies in the international arena via voluntary cooperation with a very topical empirical research focus the promotion of renewable energies in the EU It will be essential reading for scholars and students of environmental policy comparative politics and European studies

[The On-line Electric Vehicle](#) Nam P. Suh, Dong Ho Cho, 2017-04-04 This book details the design and technology of the on line electric vehicle OLEV system and its enabling wireless power transfer technology the shaped magnetic field in resonance SMFIR The text shows how OLEV systems can achieve their three linked important goals reduction of CO2 produced by ground transportation improved energy efficiency of ground transportation and contribution to the amelioration or prevention of climate change and global warming SMFIR provides power to the OLEV by wireless transmission from underground cables using an alternating magnetic field and the reader learns how this is done This cable network will in future be part of any local smart grid for energy supply and use thereby exploiting local and renewable energy generation to further its aims In addition to the technical details involved with design and realization of a fleet of vehicles combined with extensive subsurface charging infrastructure practical issues such

as those involved with pedestrian safety are considered Furthermore the benefits of reductions in harmful emissions without recourse to large banks of batteries are made apparent Importantly the use of Professor Suh s axiomatic design paradigm enables such a complicated transportation system to be developed at reasonable cost and delivered on time The book covers both the detailed design and the relevant systems engineering knowledge and draws on experience gained in the successful implementation of OLEV systems in four Korean cities The introduction to axiomatic design and the in depth discussion of system and technology development provided by The On line Electric Vehicle is instructive to graduate students in electrical mechanical and transportation engineering and will help engineers and designers to master the efficient timely and to cost implementation of large scale networked systems Managers responsible for the running of large transportation infrastructure projects and concerned with technology management more generally will also find much to interest them in this book
