Modelling, Monitoring and Diagnostic Techniques for Fluid Power Systems John Watton, 2007-03-24 This book covers the background theory of fluid power and indicates the range of concepts needed for a modern approach to condition monitoring and fault diagnosis The theory is leavened by 15 years worth of practical measurements by the author working with major fluid power companies and real industrial case studies Heavily supported with examples drawn from real industrial plants the methods in this book have been shown to work

**Pneumatic Drives** Peter Beater, 2007-02-23 The idea to use air for transmitting power is very old Ctesibius in ancient Greece described a catapult using pneumatic cylinders to first store energy and then rapidly accelerate an arrow Heron of Alexandria developed automatic temple doors which opened and closed by means of hot air And from the Greek word for breath he coined the term that was used as title for his book and today describes a whole industry pneumatics Pneumatic components and systems have become an important topic for textbooks Most have their focus on the description of the steady state behaviour practical problems like troubleshooting or Boolean algebra to help designing control algorithms Only a few textbooks covering the theoretical analysis and design of pneumatic systems have been published Z manzon et al 1965 Andersen 1967 Andersson et al 1975 But they were written at a time when digital computers were not easily available to engineers and therefore contain few material about modelling and simulation This book tries to bridge the gap between scientific disciplines fluid mechanics thermodynamics mathematics control etc the conventional approach to describe pneumatic components and systems by their steady state behaviour the wish of a design engineer to test his design before actually building hardware and the resulting need for mathematical models in order to use today's powerful digital computers

*Systemic Design Methodologies for Electrical Energy Systems* Xavier Roboam, 2012-12-17 This book proposes systemic design methodologies applied to electrical energy systems in particular analysis and system management modeling and sizing tools It includes 8 chapters after an introduction to the systemic

On Electrohydraulic Pressure Control for Power Steering Applications Alessandro Dell'Amico, 2016-02-04 This thesis deals with the Electrohydraulic Power

Steering system for road vehicles using electronic pressure control valves With an ever increasing demand for safer vehicles and fewer traffic accidents steering related active safety functions are becoming more common in modern vehicles Future road vehicles will also evolve towards autonomous vehicles with several safety environmental and financial benefits A key component in realising such solutions is active steering The power steering system was initially developed to ease the driver's workload by assisting in turning the wheels This is traditionally done through a passive open centre hydraulic system and heavy trucks must still rely on fluid power due to the heavy work forces Since the purpose of the original system is to control the assistive pressure one way would be to use proportional pressure control valves Since these are electronically controlled active steering is possible and with closed centre energy efficiency can be significantly improved on In this work such a system is analysed in detail with the purpose of investigating the possible use of the system for Boost curve control and position control for autonomous driving Commercially available valves are investigated since they provide an attractive solution A model based approach is adopted where simulation of the system is an important tool Another important tool is hardware in the loop simulation A test rig of an electrohydraulic power steering system is developed This work has shown how proportional pressure control valves can be used for Boost curve control and position control and what implications this has on a system level As it turns out the valves add a great deal of time lag and with the high gain from the Boost curve this creates a control challenge The problem can be handled by tuning the Boost gain pressure response and damping and has been effectively shown through simulation and experiments For position control there is greater freedom to design the controller to fit the system The pressure response can be made fast enough for this case and the time lag is much less critical
