data The target variable for prediction was the attrition flag which indicated whether a customer had churned or not The dataset was split into input features X and the target variable y accordingly Machine learning algorithms were then applied to predict the attrition flag Various classifiers such as Logistic Regression Decision Trees Random Forests Support Vector Machines SVM K Nearest Neighbors NN Gradient Boosting Extreme Gradient Boosting Light Gradient Boosting were utilized These models were trained using the training dataset and evaluated using appropriate performance metrics Model evaluation involved measuring the accuracy precision recall and F1 score of each classifier These metrics provided insights into how well the models performed in predicting customer attrition Additionally a confusion matrix was created to analyze the true positive true negative false positive and false negative predictions This matrix allowed for a deeper understanding of the classifier s performance and potential areas for improvement Next a deep learning approach using an artificial neural network ANN was employed for attrition flag prediction The dataset was preprocessed including features normalization one hot encoding of categorical variables and splitting into training and testing sets The ANN model architecture was defined consisting of an input layer one or more hidden layers and an output layer The number of nodes and activation functions for each layer were determined based on experimentation and best practices The ANN model was compiled by specifying the loss function optimizer and evaluation metrics Common choices for binary classification problems include binary cross entropy loss and the Adam optimizer The model was then trained using the training dataset The training process involved feeding the input features and target variable through the network updating the weights and biases using backpropagation and repeating this process for multiple epochs During training the model s performance on both the training and validation sets was monitored This allowed for the detection of overfitting or underfitting and the adjustment of hyperparameters such as the learning rate or the number of hidden layers if necessary The accuracy and loss values were plotted over the epochs to visualize the training and validation performance of the ANN These plots provided insights into the model s convergence and potential areas for improvement After training the model was used to make predictions on the test dataset A threshold of 0 5 was applied to the predicted probabilities to classify the predictions as either churned or not churned customers The accuracy score was calculated by comparing the predicted labels with the true labels from the test dataset Additionally a classification report was generated including metrics such as precision recall and F1 score for both churned and not churned customers To further evaluate the model s performance a confusion matrix was created This matrix visualized the true positive true negative false positive and false negative predictions allowing for a more detailed analysis of the model s predictive capabilities Finally a custom function was utilized to create a plot comparing the predicted values to the true values for the attrition flag This plot visualized the accuracy of the model and provided a clear understanding of how well the predictions aligned with the actual values Through this comprehensive analysis and prediction process valuable insights were gained regarding customer attrition in credit card churning scenarios The machine learning and ANN models provided

predictions and performance metrics that can be used for decision making and developing strategies to mitigate attrition Overall this project demonstrated the power of machine learning and deep learning techniques in understanding and predicting customer behavior By leveraging the available data it was possible to uncover patterns make accurate predictions and guide business decisions aimed at retaining customers and reducing attrition in credit card churning scenarios <u>Data Analysis for Corporate Finance</u> Mariano F. Scandizzo CFA CQF,2021-12-07 Have you ever tried to learn to code or to use advanced visualization tools If so I am sure you know how daunting it is to learn by yourself Generally tools and books follow an encyclopedism approach i e books attempt to teach every feature about a coding language or tool This implies hundreds if not thousands of pages simply to tackle a single topic whether SQL Python MS Excel MS PowerBI you name it The journey from zero to hero to become proficient using numerical and visualization tools to take your career to the next level becomes an ordeal that requires years and thousands of pages just to begin putting the pieces of the puzzle together However the reality is that you do not need to learn absolutely every available feature to use those tools and deliver a superior project Rather than teaching you about the forest I will discuss specific trees Why Because once you become familiar and confident nurturing a few trees growing a forest becomes a simple process of planting new trees This book provides the fundamental blocks so that you can learn about financial data science and take these tools and start using them tomorrow The scope of the selected tools will empower you to see a considerable improvement in your financial modeling skills The book is designed to provide corporate finance professionals the ability to start immediately using advance tools for concrete real world tasks Therefore this book is all about functionalism It is about providing you with tools that will put you to work and dramatically change the way you analyze data Once you see the benefits it will become natural to keep expanding your domain knowledge leveraging today s endless available educational resources *Experimental Algorithms* Catherine C.
