Industrial Metrology Graham T. Smith, 2013-04-17 The subject of this book is surface metrology in particular two major aspects surface texture and roundness It has taken a long time for manufacturing engineers and designers to realise the usefulness of these features in quality of conformance and quality of design Unfortunately this awareness has come at a time when engineers versed in the use and specification of surfaces are at a premium Traditionally surface metrology usage has been dictated by engineers who have served long and demanding apprenticeships usually in parallel with studies leading to technician level qualifications Such people understood the processes and the achievable accuracies of machine tools thereby enabling them to match production capability with design requirements This synergy has been made possible by the understanding of adherence to careful metrological procedures and a detailed knowledge of surface measuring instruments and their operation in addition to wider inspection room techniques With the demise in the UK of polytechnics and technical colleges this source of skilled technicians has all but dried up The shortfall has been made up of semi skilled craftsmen or inexperienced graduates who cannot be expected to satisfy traditional or new technology needs Miniaturisation for example has had a profound effect Engineering parts are now routinely being made with nanometre surface texture and flatness At these molecular and atomic scales the engineer has to be a physicist

Comprehensive Materials Finishing M.S.J. Hashmi, 2016-08-29 Finish Manufacturing Processes are those final stage processing techniques which are deployed to bring a product to readiness for marketing and putting in service Over recent decades a number of finish manufacturing processes have been newly developed by researchers and technologists Many of these developments have been reported and illustrated in existing literature in a piecemeal manner or in relation only to specific applications For the first time Comprehensive Materials Finishing Three Volume Set integrates a wide body of this knowledge and understanding into a single comprehensive work Containing a mixture of review articles case studies and research findings resulting from R Finish Machining Processes by which a small layer of material is removed from the surface by various machining processes to render improved surface characteristics and Surface Coating Processes by which the surface properties are improved by adding fine layers of materials with superior surface characteristics Each of these primary finishing processes is presented in its own volume for ease of use making Comprehensive Materials Finishing an essential reference source for researchers and professionals at all career stages in academia and industry Provides an interdisciplinary focus allowing readers to become familiar with the broad range of uses for materials finishing Brings together all known research in materials finishing in a single reference for the first time Includes case studies that illustrate theory and show how it is applied in practice

Gears

Vincenzo Vullo, 2020-02-21 This book explores the geometric and kinematic design of the various types of gears most commonly used in practical applications also considering the problems concerning their cutting processes The cylindrical spur and helical gears are first considered determining their main geometric quantities in the light of interference and undercut problems as well as the related kinematic parameters Particular attention is paid to the profile shift of these types of gears either generated by rack type cutter or by pinion rack cutter Among other things profile shifted toothing allows to obtain teeth shapes capable of greater strength and more balanced specific sliding as well as to reduce the number of teeth below the minimum one to avoid the operating interference or undercut These very important aspects of geometric kinematic design of cylindrical spur and helical gears are then generalized and extended to the other examined types of gears most commonly used in practical applications such as straight bevel gears crossed helical gears worm gears spiral bevel and hypoid gears Finally ordinary gear trains planetary gear trains and face gear drives are discussed This is the most advanced reference guide to the state of the art in gear engineering Topics are addressed from a theoretical standpoint but in such a way as not to lose sight of the physical phenomena that characterize the various types of gears which are examined The analytical and numerical solutions are formulated so as to be of interest not only to academics but also to designers who deal with actual engineering problems concerning the gears

Bio-inspired Tactile Sensing Moritz Scharf, 2021-01-01

The transfers of natural mechanisms and structures into artificial technical applications are successful approaches for innovation and become more important nowadays The concept of Biomechatronics provides a structured framework to do so Following these ideas this work analyses a novel tactile sensor inspired by natural vibrissae The sense of touch is an indispensable part of the sensory system of living beings In e.g. rats the so called vibrissal system including long sensory hairs around the muzzle of the animals vibrissae is an essential part of tactile perception Rats can determine the location shape and texture of an object by touching it with their vibrissae Transferring these abilities to an artificial sensor design the interaction between the hair sensor shaft and different objects are analyzed The sensor hair shaft fulfills different functions in terms of a preprocessing of the captured signals Therefore by knowing and controlling these effects the captured signals can be optimized in a way that particular information inside the captured signals is pronounced

Burrs - Analysis, Control and Removal Jan C. Aurich,David A. Dornfeld,2009-12-01 In many machining operations burrs cannot be avoided They can affect the functionality and the safe handling of the workpiece in the subsequent processing and have to be removed by a special deburring process Toleration of burrs which are not part of functional edges depends on their respective shape and size High inspection effort is necessary to guarantee the workpiece quality Therefore the research results on burrs with a focus on burr analysis and control as well as on cleanability and burr removal based on the presentations held at the conference are valuable for researchers and engineers in manufacturing development
