Lysosomal Cysteine Proteinases and Their Role in Visceral Yolk Sac Mediated Nutrition and Embryotoxicity Jeffrey Lee Ambroso, 1994 **Role of Proteases in the Pathophysiology of Neurodegenerative Diseases** Abel Lajtha, Naren L. Banik, 2007-05-08

Researchers seeking problems that offer more hope of success often avoid subjects that seem to be difficult to approach experimentally or subjects for which experimental results are difficult to interpret. The breakdown part of protein turnover in vivo particularly in nervous tissue was such a subject in the past it was difficult to measure and difficult to explore the mechanisms involved. For factors that influence protein metabolism it was thought that protein content, function and distribution are controlled only by the synthetic mechanisms that can supply the needed specificity and response to stimuli. The role of breakdown was thought to be only a general metabolic digestion/elimination of excess polypeptides. We now know that the role of breakdown is much more complex; it has multiple functions, it is coupled to turnover and it can affect protein composition, function and synthesis. In addition to eliminating abnormal proteins, breakdown has many modulatory functions: it serves to activate and inactivate enzymes, modulate membrane function, alter receptor channel properties, affect transcription and cell cycle, form active peptides and much more. The hydrolysis of peptide bonds often involves multiple steps, many enzymes and cycles such as ubiquitination and often requires the activity of enzyme complexes. Their activation, modification and inactivation can thus play an important role in biological functions with numerous families of proteases participating. The specific role of each remains to be elucidated.

The Role of Lysosomal Cysteine Proteases in Endocytosis-mediated Retinal Degeneration Ronald D. Kinser, 2012

Many retinal degenerative diseases result in blindness. The causes and clinical progression of these diseases are heterogeneous in nature. In many instances the genes involved are known yet the molecular mechanisms leading to blindness still require elucidation. Our lab utilizes the *norpA* mutant which undergoes light dependent retinal degeneration as a cell death model. Previous characterization of *norpA* has shown that rhodopsin and arrestin form stabilized complexes that are internalized into the cell body in response to light. Furthermore, this mass endocytosis of rhodopsin leads to its aggregation and accumulation in the late endosome. Accumulation of proteins in the endosomal system has been shown to lead to the permeabilization of endosomes and lysosomes subsequently allowing translocation of the resident cathepsins to the cytosol. Cathepsins are lysosomal proteases that have been shown to mediate cell death when translocated from the endosomal system. In this thesis I describe the role of the lysosomal cysteine proteases in endocytosis mediated retinal degeneration. Using a combination of techniques in genetics, cell biology and biochemistry we show the specific involvement of the cathepsin L like protease CP1. Retinal degeneration in *norpA* retinas can be blocked by mutation of the *Cp1* gene or expression of the pan cysteine cathepsin inhibitor cystatin. Conversely, retinal degeneration can be accelerated in *norpA* retinas by overexpressing CP1. Interestingly, there is a decrease in CP1 immunofluorescence accompanied by a decrease in rhodopsin colocalization in the *norpA* mutant compared to wild.

type suggesting a CP1 redistribution event in norpA retinas in response to light We also examined cathepsin involvement in a broader range of neurodegenerative disorders Although cathepsins were not implicated in many we discovered a role for cathepsins in the retinal degeneration observed in Drosophila trafficking mutants This suggests that cathepsins may be involved in a broader group of retinal degenerative disorders caused by defects in endosomal trafficking Lastly we identified a novel role for the Toll signaling pathway in endocytosis mediated cell death as mutations to Toll and dorsal block retinal degeneration These data represent a novel molecular pathway leading to cell death in Drosophila A potential link between Toll activation and cathepsins function is discussed

Proteases: Structure and Function Klaudia Brix,Walter Stöcker,2014-01-21 Proteolysis is an irreversible posttranslational modification affecting each and every protein from its biosynthesis to its degradation Limited proteolysis regulates targeting and activity throughout the lifetime of proteins Balancing proteolysis is therefore crucial for physiological homeostasis Control mechanisms include proteolytic maturation of zymogens resulting in active proteases and the shut down of proteolysis by counteracting endogenous protease inhibitors Beyond the protein level proteolytic enzymes are involved in key decisions during development that determine life and death from single cells to adult individuals In particular we are becoming aware of the subtle role that proteases play in signaling events within proteolysis networks in which the enzymes act synergistically and form alliances in a web like fashion Proteases come in different flavors At least five families of mechanistically distinct enzymes and even more inhibitor families are known to date many family members are still to be studied in detail We have learned a lot about the diversity of the about 600 proteases in the human genome and begin to understand their physiological roles in the degradome However there are still many open questions regarding their actions in pathophysiology It is in this area where the development of small molecule inhibitors as therapeutic agents is extremely promising Approaching proteolysis as the most important irreversible post translational protein modification essentially requires an integrated effort of complementary research disciplines In fact proteolytic enzymes seem as diverse as the scientists working with these intriguing proteins This book reflects the efforts of many in this exciting field of research where team and network formations are essential to move ahead

overwhelming success of the Second Edition which appeared in 2009 and fast recent development in the different fields of cancer research it has been decided to publish a third fully revised and expanded edition following the principal concept of the first edition that has proven so successful. Recent developments are seeing a dynamic progress in basic and clinical cancer science with translational research increasingly becoming a new paradigm in cancer research. In particular, new approaches to both Personalized Cancer Medicine and Targeted Therapies have made promising progress. While the Second Edition featured scholarly contributions from approximately 1 000 scientists/clinicians in four Volumes, the Third Edition includes 1 300 contributors in 7 Volumes with an A-Z format of approx. 7000 entries. It provides definitions of common acronyms and short definitions of related terms and processes in the form of keyword entries. In addition, there are detailed essays which provide comprehensive information on syndromes, genes and molecules and processes and methods. Each essay is well structured with extensive cross referencing between all entries. In the Third Edition, topical Essays present a comprehensive picture of major cancers such as Breast Cancer, Colorectal Cancer, Prostate Cancer, Ovarian Cancer, Renal Cancer, Lung Cancer and Hematological Malignancies, Leukemias and Lymphomas. For each of these cancers, different authoritative Essays are included that cover topics ranging from Pathology to Clinical Oncology and Targeted Therapies. This new feature should meet the expectation that a wide community has towards a major cancer reference work. The Encyclopedia of Cancer will be accessible both in print and online and this information source should be of value to both the clinical and basic scientific community as well as to the public.

Proteases and Their Receptors in Inflammation Nathalie Vergnolle, Michel Chignard, 2011-08-03. Proteases are everywhere from prokaryotes to eukaryotes, from virus to bacteria and in all human tissues, playing a role in many biological functions. Among these functions, the inflammatory reaction is of particular interest. In inflamed tissues, proteases can have a microbial and/or host origin and are involved not only in tissue remodeling but also in specific signaling to resident or inflammatory cells, thereby contributing to the innate immune response. This volume presents all advances in our knowledge of the role proteases and their inhibitors play in various diseases associated with inflammatory response. Mechanisms involved in protease signaling to cells are presented and the different types of proteases that are present at inflammatory sites and their effects on the course of inflammation are discussed. Finally, the evidence for considering proteases and their receptors as potential molecular targets for therapeutic interventions in the treatment of inflammatory diseases is discussed in the context of specific organ inflammatory pathologies: the lung, gastrointestinal tract, skin, joints, etc.

Cellular Peptidases in Immune Functions and Diseases 2 Jürgen Langner, Siegfried Ansorge, 2006-04-11. Of the many special roles played by proteolytic enzymes in immune reactions, this book addresses different aspects of membrane peptidases: signal transduction via ligation of membrane peptidases, especially dipeptidyl peptidase IV (CD26) and aminopeptidase N (CD13), and regulation of membrane peptidases in vivo and in vitro. A number of newly discovered peptidases, including cathepsin F, W and X, carboxypeptidase X, attractin, are described with

special emphasis given to the role of peptidases in immune and defense reactions and in the pathogenesis of inflammatory and other diseases including rheumatoid arthritis pancreatitis multiple sclerosis Alzheimer s disease and tumours of various origins The focus on the involvement of a selection of proteolytic enzymes in immune reactions and diseases is a unique feature of this multifaceted work which combines biochemical immunological and clinical research reports with literary reviews of the field
