Mathematical Methods for Protein Structure Analysis and Design Concettina Guerra, Sorin Istrail, 2003-06-25 The papers collected in this volume reproduce contributions by leading scholars to an international school and workshop which was organized and held with the goal of taking a snapshot of a discipline undergoing tumultuous growth Indeed the area of protein folding docking and alignment is developing in response to needs for a mix of heterogeneous expertise spanning biology chemistry mathematics computer science and statistics among others Some of the problems encountered in this area are not only important for the scientific challenges they pose but also for the opportunities they disclose in terms of medical and industrial exploitation A typical example is offered by protein drug interaction docking a problem posing daunting computational problems at the crossroads of geometry physics and chemistry and at the same time a problem with unimaginable implications for the pharmacopoeia of the future The school focused on problems posed by the study of the mechanisms hindering protein folding and explored different ways of attacking these problems under

objective evaluations of the methods Together with a relatively small core of consolidated knowledge and tools important reactions were brought to this effort by studies in a multitude of directions and approaches It is obviously impossible to predict which if any among these techniques will prove completely successful but it is precisely the implicit dialectic among them that best conveys the current flavor of the field Such unique diversity and richness inspired the format of the meeting and also explains the slight departure of the present volume from the typical format in this series the exposition of the current sediment is complemented here by a selection of qualified specialized contributions

Intelligent active vision systems for robots Erik Valdemar Cuevas Jiménez, Daniel Zaldívar Navarro, Raúl Rojas, 2007-01-08 In this paper an active vision system is developed which is based on image strategy The image based control structure uses the optical flow algorithm for motion detection of an object in a visual scene Because the optical flow is very sensitive to changes in illumination or to the quality of the video it was necessary to use median filtering and erosion and dilatation morphological operations for the decrease of erroneous blobs residing in individual frames Since the image coordinates of the object are subjected to noise the Kalman filtering technique is adopted for robust estimation A fuzzy controller based on the fuzzy condensed algorithm allows real time work for each captured frame Finally the proposed active vision system has been simulated in the development simulation environment Matlab Simulink
