Atomic Processes in Electron-Ion and Ion-Ion Collisions F. Brouillard, 2013-03-09 Four years after a first meeting in BADDECK Canada on the Physics of Ion Ion and Electron Ion collisions a second Nato Advanced Study Institute in HAL Lesse Belgium reexamined the subject which had become almost a new one in consideration of the many important developments that had occurred in the mean time The developments have been particularly impressive in two areas the dielectronic recombination of electrons with ions and the collisional processes of multiply charged ions For dielectronic recombination a major event was the obtainment in 1983 of the first experimental data This provided at last a non speculative basis for the study of that intricate and subtle process and strongly stimulated the theoretical activities Multiply charged ions on the other hand have become popular thanks to the development of powerful ion sources This circumstance together with a pressing demand from thermonuclear research for ionisation and charge exchange cross sections has triggered systematic experimental investigations and new theoretical studies which have contributed to considerably enlarge over the last five years our understanding of the collisional processes of multiply charged ions Dielectronic recombination and multiply charged ions were therefore central points in the programme of the ASI in HAL Lesse and are given a corresponding emphasis in the present book

Dynamics of Molecular Collisions W. Miller, 2012-12-06

Activity in any theoretical area is usually stimulated by new experimental techniques and the resulting opportunity of measuring phenomena that were previously inaccessible. Such has been the case in the area under consideration here beginning about fifteen years ago when the possibility of studying chemical reactions in crossed molecular beams captured the imagination of physical chemists for one could imagine investigating chemical kinetics at the same level of molecular detail that had previously been possible only in spectroscopic investigations of molecular structure. This created an interest among chemists in scattering theory, the molecular level description of a bimolecular collision process. Many other new and also powerful experimental techniques have evolved to supplement the molecular beam method and the resulting wealth of new information about chemical dynamics has generated the present intense activity in molecular collision theory. During the early years when chemists were first becoming acquainted with scattering theory it was mainly a matter of reading the physics literature because scattering experiments have long been the staple of that field. It was natural to apply the approximations and models that had been developed for nuclear and elementary particle physics and although some of them were useful in describing molecular collision phenomena many were not. The most relevant treatise then available to students was Mott and Massey's classic *The Theory of Atomic Collisions* but as the title implies it dealt only sparingly with the special features that arise when at least one of the collision partners is a molecule. *Progress in Atomic Spectroscopy* W.

Hanle, 2013-11-11 H J BEYER AND H KLEINPOPPEN During the preparation of Parts A and B of *Progress in Atomic Spectroscopy* a few years ago it soon became obvious that a comprehensive review and description of this field of modern atomic physics could not be achieved within the limitations of a two volume book. While it was possible to include a large variety of spectroscopic methods inevitably some fields had to be cut short or left out altogether. Other fields have developed so rapidly that they demand full cover in an additional volume. One of the major problems already encountered during the preparation of the first volumes was to keep track of new developments and approaches which result in spectroscopic data. We have to look far beyond the area of traditional atomic spectroscopy since methods of atomic and ion collision physics, nuclear physics and even particle physics all make important contributions to our knowledge of the static and dynamical state of atoms and ions and thereby greatly add to the continuing fascination of a field of research which has given us so much fundamental knowledge since the middle of the last century. In this volume we have tried to strike a balance between contributions belonging to the more established fields of atomic structure and spectroscopy and those fields where atomic spectroscopy overlaps with other areas. *Optics and Spectroscopy*, 1986 *The Role of Rydberg States in Spectroscopy and*

Photochemistry C. Sándorfy, 2006-04-11 The aim of this volume is to offer a balanced overview of molecular Rydberg spectroscopy as it has developed over recent decades. Recent evolution has split Rydberg spectroscopy into two apparently distinct fields: the one concerns the low n 3-5 Rydberg states, the other the very high typically EM_n EM_{150} Rydberg states. The former is aimed at spectral levels where Rydberg valence shell and intermediate type states interact with a variety of

photochemical consequences The latter considers states extremely close to the ionization limit from where ionization is possible with a very slight amount of additional energy Recently developed techniques make it possible to produce ions in well defined electronic vibrational and rotational states including states resulting from spin orbit or Jahn Teller splitting It is then possible to study the structure and reactions of such state selected ions as well as those of the corresponding neutral molecules These techniques amount to badly needed high resolution photoelectron spectroscopy

Dynamics of Ion-Molecule Complexes William L Hase, 2016-07-29

Advances in Classical Trajectory Methods Volume 2 Dynamics of Ion Molecule Complexes is a seven chapter text that covers the considerable advances in the experimental and theoretical aspects of ion molecular complexes with particular emphasis on the dynamics and kinetics of their formation and ensuing unimolecular dissociation This text also considers the development and testing of theoretical models for these formation and decomposition processes The opening chapters discuss photoelectron photoion coincidence ion cyclotron resonance and crossed molecular beam studies of metastable ion molecule complexes formed in ion molecule collisions These experimental studies involve comparisons with the predictions of statistical models such as the Rice Ramsperger Kassel Marcus and phase space theories and comparisons with the reaction dynamics predicted by classical trajectory calculations The succeeding chapter describes the double well model for ion molecular reactions taking place on a potential energy surface with a central barrier that separates two potential energy minima These topics are followed by reviews of the quantum chemical calculation and reaction path Hamiltonian analysis of SN2 reactions the transition state theory for ion dipole and ion quadrupole capture and the capture and dynamical models for ion molecule association to form a complex The remaining chapters consider the temperature dependence of ion molecule reactions which proceed on a surface with many potential energy minima specifically the ability to establish asymptotic limits for the reaction efficiency dependent upon the number of potential minima and the above relative probabilities This book is of

great value to experimental and theoretical chemists and physicists
