

Archaeocyatha from the Lower Cambrian of Peary Land, central North Greenland

Françoise Debrenne and John S. Peel

Archaeocyatha are reported from the Paralleldal Formation of the Brønlund Fjord Group, Peary Land, central North Greenland. Three new species are described and assigned to genera known from the upper part of the Lower Cambrian on the Siberian platform and in the Altai fold belt region. New taxa: *Tegerocyathella inesonii* sp. nov., *Tegerocyathus greenlandensis* sp. nov., *Archaeocyathus pearylandensis* sp. nov.

F. D., Institut de Paléontologie, Centre National de la Recherche Scientifique, ER 154, 8 Rue de Buffon, 75005 Paris, France.
J. S. P., Grønlands Geologiske Undersøgelse, Øster Voldgade 10, DK-1350 København K, Denmark.

The Archaeocyatha reported in this paper are the first recorded from the Cambrian of North Greenland, with the exception of a few crushed and silicified remains from the same general locality, which are too poor to merit description. The locality was discovered by Jon R. Ineson (University of Keele, now British Antarctic Survey) during summer field work in 1979, although the material described here results from collections made in the following summer. The locality lies on the north side of Sæterdal, near its junction with Paralleldal, southern Peary Land, central North Greenland (fig. 1) where cliffs of mainly Lower Cambrian carbonates rise above the drift filled valley floor.

All described specimens are from GGU sample 274908 collected from the Paralleldal Formation (fig. 2) of the Brønlund Fjord Group (Ineson & Peel, in press), corresponding to the informally described formation 6 of Ineson & Peel (1980) and Peel (1982). This formation attains its maximum observed thickness of 165 m in the Sæterdal area and, at the collection locality, can be subdivided into two units. The lower, dark weathering unit consists of dark grey, silty, laminated dolomites which yield the crushed archaeocyathans noted above, associated with a rich silicified fauna of brachiopods (*Kutorgina*), molluscs (hyolithids, yochelcionellaceans), *Chancelloria* and trilobites (*Kootenia*, *Olenellus*) of Early Cambrian age. The dark dolomites are overlain by, and interdigitate to the south with, thick, massive, pale weathering crystalline dolomite. Finely crystalline mottled dolomite with archaeocyathans and rare trilobites occurs locally, but the dominant lithology is coarsely recrystallised, structureless, vuggy dolomite. *Salterella maccullochi* (Murchison, 1859) was described from the same unit by Peel & Yochelson (1982) and, together with the archaeocyathans, confirms an Early Cambrian age.

The archaeocyathan assemblage from Peary Land contains *Tegerocyathus* (the most abundant), *Archaeocyathus* and *Tegerocyathella*. It is typical of the middle-late Toyonian stage

Lower Cambrian Archaeocyatha From The Aj
