P. Newnham, M. G. Cardio-Respiratory Control in Vertebrates Mogens L. Glass, Stephen C. Wood, 2009-07-24 Hopefully this book will be taken off of the shelf frequently to be studied carefully over many years More than 40 researchers were involved in this project which examines respiration circulation and metabolism from sh to the land vertebrates including human beings A breathable and stable atmosphere rst appeared about 500 million years ago Oxygen levels are not stable in aquatic environments and exclusively water breathing sh must still cope with the ever changing levels of O₂ and with large temperature changes This is reflected in their sophisticated count current systems with high O₂ extraction and internal and external O₂ receptors 2.2 The conquest for the terrestrial environment took place in the late Devonian period 355-359 million years ago and recent discoveries portray the gradual transitional evolution of land vertebrates The oxygen rich and relatively stable atmospheric conditions implied that oxygen sensing mechanisms were relatively simple and in gain compared with acid base regulation Recently physiology has expanded into related fields such as biochemistry molecular biology morphology and anatomy In the light of the work in these fields the introduction of DNA based cladograms which can be used to evaluate the likelihood of land vertebrates and lung sh as a sister group could explain why their cardio respiratory control systems are similar The diffusing capacity of a duck lung is 40 times higher than that of a toad or lung sh Certainly some animals have evolved to rich high performance levels

The Oxford Handbook of Evolutionary Medicine Martin Brüne, Wulf Schiefenhövel, 2019-01-31

Medicine is grounded in the natural sciences where biology stands out with regard to our understanding of human physiology and the conditions that cause dysfunction Ironically though evolutionary biology is a relatively disregarded field One reason for this omission is that evolution is deemed a slow process Indeed the macroanatomical features of our species have changed very little in the last 300 000 years A more detailed look however reveals that novel ecological contingencies partly in relation to cultural evolution have brought about subtle changes pertaining to metabolism and immunology including adaptations to dietary innovations as well as adaptations to the exposure to novel pathogens Rapid pathogen evolution and evolution of cancer cells cause major problems for the immune system Moreover many adaptations to past ecologies have actually turned into risk factors for somatic disease and psychological disorder in our modern worlds i.e. mismatch among which epidemics of autoimmune diseases cardiovascular diseases diabetes and obesity as well as several forms of cancer stand out One could add depression anxiety and other psychiatric conditions to the list

The Oxford Handbook of Evolutionary Medicine is a compilation of up to date insights into the evolutionary history of ourselves as a species exploring how and why our evolved design may convey vulnerability to disease Written in a classic textbook style emphasising physiology and pathophysiology of all major organ systems the *Oxford Handbook of Evolutionary Medicine* is valuable reading for students
