## Lymph and lymph vessels

Lymph is a clear, colorless fluid that circulates through the lymphatic system. It is composed of water, electrolytes, and small proteins. Lymph vessels are thin-walled, non-muscular tubes that collect and transport lymph. They are found throughout the body, with a high concentration in the head and neck region.

## Lymph nodes

Lymph nodes are small, bean-shaped structures that filter lymph and trap foreign particles. They are located throughout the lymphatic system, with a high concentration in the head and neck region. Lymph nodes are composed of lymphoid tissue, which is made up of lymphocytes and other immune cells.

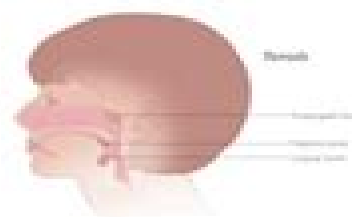

## Inflammatory and immune responses

The lymphatic system plays a central role in the body's inflammatory and immune responses. It is responsible for the transport of immune cells, such as lymphocytes, to sites of infection and inflammation. Lymph nodes act as filters, trapping foreign particles and presenting them to immune cells. This process is essential for the body's ability to recognize and respond to threats.

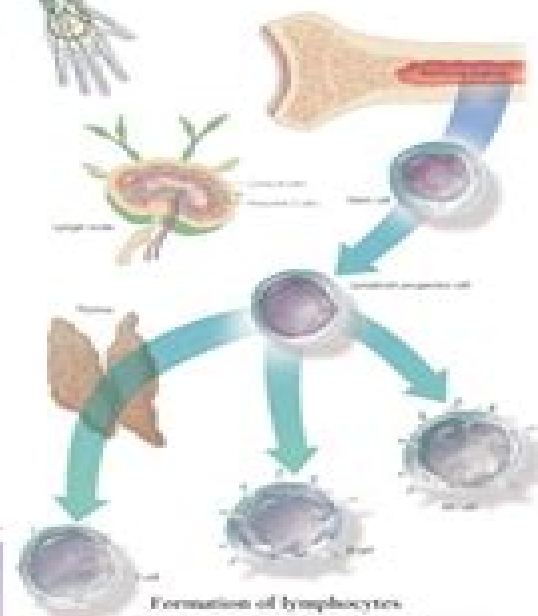

## What is the lymphatic system?

The lymphatic system is a network of vessels and organs that collect and transport lymph. It is a part of the body's immune system, responsible for the transport of immune cells and the removal of waste. The lymphatic system is found throughout the body, with a high concentration in the head and neck region.

## Lymphoid intestinal tissue

Lymphoid intestinal tissue is a type of lymphoid tissue found in the lining of the small intestine. It is responsible for the production and transport of lymphocytes, which are immune cells that help the body fight infection.

## Formation of lymphocytes

Lymphocytes are formed from hematopoietic stem cells in the bone marrow. These cells differentiate into B cells, T cells, and natural killer cells. B cells are responsible for the production of antibodies, while T cells and natural killer cells are involved in the body's cellular immune response.
