By C. W. Gear

**Abstract.** Multistep methods for initial value problems are expressed in a matrix form. The application of such methods to higher-order equations is studied with the result that new techniques for both first- and higher-order equations are found. The direct approach to higher-order equations is believed to offer speed and accuracy advantages; some numerical evidence is presented. The new technique applied to first-order equations is a slight extension of the conventional multistep method and avoids the Dahlquist [2] stability theorem, that is, these new  $k$ -step methods are of order  $2k$  and yet convergent. The matrix formalism introduced provides an easy mechanism for examining the equivalence of methods as introduced by Descloux [3]. It is pointed out that the new first-order method on  $k$ -steps, Adams' method on  $(2k - 1)$ -steps and Nordsieck's [7] method with  $2k$  components are equivalent to each other. In fact, all methods discussed can be placed in equivalence classes so that theorems need only be proved for one member of each class. The choice between the members of a class can be made on the basis of round-off errors and amount of computation only. Arguments are given in favor of the extension of Nordsieck's method for general use because of its speed and applicability to higher order problems directly. The theorems ensuring convergence and giving the asymptotic form of the error are stated. The proofs can be found in a cited report.

**1. Introduction.** This paper is concerned with the integration of initial value problems for a system of ordinary differential equations of the form

$$(1.1) \quad y_i^{(p_i)} = f_i(x, y_1, \dots, y_k^{(p_1-1)}, y_{k+1}, \dots, y_s^{(p_s-1)}), \quad i = 1, 2, \dots, s,$$

where  $y^{(p_i)} = d^p y / dx^p$ . The motivation for the work was to try and integrate such equations directly rather than as a larger system of first-order equations. The study led to a matrix representation for multistep methods that is an extension of a similar representation due to Descloux [3]. This representation provides a unified approach to equations of all orders; it is sufficient and easier to study it in detail for first-order equations. The usual theorems of stability and convergence, etc. are stated for general higher-order systems in Section 5. The proofs can be found in Gear [5].

**2. Multistep Methods.** The equation  $y' = f(x, y)$  is frequently integrated numerically by a predictor-corrector algorithm of the following form:

Let  $x_n = x_0 + nh$  where  $h$  is the step size, and let  $y_n$  and  $y'_n$  be approximations to the values of  $y(x_n)$  and  $dy(x_n)/dx$  obtained in some manner. The values of  $y$  and  $y'$  at  $x_{n+1}$  are found by the sequence of steps: predictor formula

$$(2.1) \quad y_{n+1}^{(0)} = \sum_{j=1}^k (\alpha_j^{(0)} y_{n-j+1} + \beta_j^{(0)} h y'_{n-j+1}),$$

### **Numerical Integration of Space Fractional Partial Differential Equations** Younes Salehi, William E.

Schiesser, 2017-12-06 Partial differential equations (PDEs) are one of the most used widely forms of mathematics in science and engineering. PDEs can have partial derivatives with respect to 1 an initial value variable typically time and 2 boundary value variables typically spatial variables. Therefore two fractional PDEs can be considered 1 fractional in time TFPDEs and 2 fractional in space SFPDEs. The two volumes are directed to the development and use of SFPDEs with the discussion divided as Vol 1 Introduction to Algorithms and Computer Coding in R Vol 2 Applications from Classical Integer PDEs. Various definitions of space fractional derivatives have been proposed. We focus on the Caputo derivative with occasional reference to the Riemann-Liouville derivative. In the second volume the emphasis is on applications of SFPDEs developed mainly through the extension of classical integer PDEs to SFPDEs. The example applications are Fractional diffusion equation with Dirichlet, Neumann and Robin boundary conditions, Fisher, Kolmogorov, SFPDE, Burgers, SFPDE, Fokker Planck, SFPDE, Burgers, Huxley, SFPDE, Fitzhugh-Nagumo, SFPDE. These SFPDEs were selected because they are integer first order in time and integer second order in space. The variation in the spatial derivative from order two parabolic to order one first order hyperbolic demonstrates the effect of the spatial fractional order with 1/2. All of the example SFPDEs are one dimensional in Cartesian coordinates. Extensions to higher dimensions and other coordinate systems in principle follow from the examples in this second volume. The examples start with a statement of the integer PDEs that are then extended to SFPDEs. The format of each chapter is the same as in the first volume. The R routines can be downloaded and executed on a modest computer. R is readily available from the Internet.
