Nutritional And Toxicological Aspects Of Food Safety:

Nutritional and Toxicological Aspects of Food Safety Mendel Friedman, 1984 Nutritional and Toxicological Aspects of Food Safety Mendel Friedman, 2012-12-06 Naturally occurring antinutrients and food toxicants and those formed during food processing adversely affect the nutritional quality and safety of foods. Because of the need to improve food quality and safety by plant breeding fortification with appropriate nutrients and processing methods and because of the growing concern about possible direct relationships between diet and diseases, research is needed to: 1) evaluate the nutritive quality and safety of crops and fortified supplemented and processed foods; 2) define conditions that favor or minimize the formation of nutritionally antagonistic and toxic compounds in foods; and 3) define the toxicology, metabolism, and mechanisms of the action of food ingredients and their metabolites. As scientists interested in improving the safety of the food supply, we are challenged to respond to the general need for exploring: 1) possible adverse consequences of antinutrients and food toxicants; and 2) factors which contribute to the formation and inactivation of undesirable compounds in foods. Medical research offers an excellent analogy. Studies on causes and mechanisms of disease processes are nearly always accompanied by parallel studies on preventive measures and cures. Such an approach offers the greatest possible benefits to the public.

Nutritional and Toxicological Consequences of Food Processing Mendel Friedman, 2013-11-21 A variety of processing methods are used to make foods edible, to permit storage, to alter texture and flavor, to sterilize and pasteurize food, and to destroy microorganisms and other toxins. These methods include baking, broiling, cooking, freezing, frying, and roasting. Many such efforts have both beneficial and harmful effects. It is a paradox of nature that the processing of foods can improve nutrition, quality, safety, and taste, and yet occasionally lead to the formation of anti-nutritional and toxic compounds. These multifaceted consequences of food processing arise from molecular interactions among nutrients with each other and with other food ingredients. Since beneficial and adverse effects of food processing are of increasing importance to food science, nutrition, and human health, and since many of the compounds formed have been shown to be potent carcinogens and growth inhibitors in animals, I organized a symposium broadly concerned with the nutritional and toxicological consequences of food processing. The symposium was sponsored by the American Institute of Nutrition (AIN) and the Federation of American Societies for Experimental Biology (FASEB) for its annual meeting in Washington, D.C., April 1-5, 1990. Invited speakers were asked to develop at least one of the following topics: 1) Nutrient-nutrient interactions between amino acids, proteins, carbohydrates, lipids, minerals, vitamins, tannins, fiber, natural toxicants, etc.; 2) Effects of radiation; 3) Thermally induced formation of dietary mutagens, antimutagens, carcinogens, anticarcinogens, antioxidants, and growth inhibitors; 4) Effects of pH on nutritional value and safety.

Nutritional and Toxicological Significance of Enzyme Inhibitors in Foods Mendel Friedman, 2013-03-09 Soybean proteins are widely used in human foods in a variety of forms including baby formulas, flour, soy protein concentrates, soy protein isolates, soy sauces, textured soy fibers, and tofu. The presence of inhibitors of digestive

enzymes in soy proteins impairs nutritional quality and possible safety of this important legume Normal processing conditions based on the use of heat do not completely inactivate these inhibitors so that residual amounts of plant protease inhibitors are consumed by animals and man Inhibitors of digestive enzymes are present not only in legumes such as soybeans lima beans and kidney beans but also in nearly all plant foods including cereals and potatoes albeit in much smaller amounts The antinutritional effects of inhibitors of proteolytic enzymes have been widely studied and can be ameliorated by processing and or sulfur amino acid fortification A more urgent concern is reports that rats fed diets containing even low levels of soybean derived inhibitors which are found in foods such as soy based baby formulas may develop over their lifespan pancreatic lesions leading eventually to neoplasia or tumor formation On the other hand recent studies suggest that certain enzyme inhibitors from plant foods may prevent cancer formation in other tissues A key question therefore is whether inhibitors from plant foods constitute a human health hazard
