The Oxford Handbook of the Archaeology of Diet Julia Lee-Thorp, M. Anne Katzenberg, 2024-06-24 Humans are unique among animals for the wide diversity of foods and food preparation techniques that are intertwined with regional cultural distinctions around the world The Oxford Handbook of the Archaeology of Diet explores evidence for human diet from our earliest ancestors through the dispersal of our species across the globe As populations expanded people encountered new plants and animals and learned how to exploit them for food and other resources Today globalization aside the results manifest in a wide array

of traditional cuisines based on locally available indigenous and domesticated plants and animals How did this complexity emerge When did early hominins actively incorporate animal foods into their diets and later exploit marine and freshwater resources What were the effects of reliance on domesticated grains such as maize and rice on past populations and the health of individuals How did a domesticated plant like maize move from its place of origin to the northernmost regions where it can be grown Importantly how do we discover this information and what can be deduced about human health biology and cultural practices in the past and present Such questions are explored in thirty three chapters written by leading researchers in the study of human dietary adaptations The approaches encompass everything from information gleaned from comparisons with our nearest primate relatives tools used in procuring and preparing foods skeletal remains chemical or genetic indicators of diet and genetic variation and modern or historical ethnographic observations Examples are drawn from across the globe and information on the research methods used is embedded within each chapter The Handbook provides a comprehensive reference work for advanced undergraduate and graduate students and for professionals seeking

Mark Nichter, 2020-06-19 In this lesson packed book Mark Nichter one of the world's leading medical anthropologists summarizes what more than a quarter century of health social science research has contributed to international health and elucidates what social science research can contribute to global health and the study of biopolitics in the future Nichter focuses on our cultural understanding of infectious and vector borne diseases how they are understood locally and how various populations respond to public health interventions The book examines the perceptions of three groups whose points of view on illness health care and the politics of responsibility often differ and frequently conflict local populations living in developing countries public health practitioners working in international health and health planners policy makers The book is written for both health social scientists working in the fields of international health and development and public health practitioners interested in learning practical lessons they can put to good use when engaging communities in participatory problem solving Global Health critically examines representations that frame international health discourse It also addresses the politics of what is possible in a world compelled to work together to face emerging and re-emerging diseases the control of health threats associated with political ecology and defective modernization and the rise of new assemblages of people who share a sense of biosociality The book proposes research priorities for a new program of health social science research Nichter calls for greater involvement by social scientists in studies of global health and emphasizes how medical anthropologists in particular can better involve themselves as scholar activists

Social Behaviour of Children Ralph E. S. Tanner, 2007 Contents Acknowledgements 1 Introduction 2 Irregularity and Indistinct socialisation 3 Ethology and pro social behaviour 4 Anthropology and pro social behaviour 5 Social environments a typology 6 Methodology the difficulties of data collection 7 Language and pro social development 8 Change and the pro social behaviour of the growing child 9 Social and physical environmental variations affecting the growing child 10 Parental care and the scarcity of uniformities 11 Education 12 Anti social behaviour 13 Generational relations and pro social behaviour 14 The transition in moral development Bibliography Index The behaviour of children within ages defined in most countries without regard to biological maturity or social usefulness is often concentrated on their failure and the failure of their carers to conform to what their societies expect of them This study attempts to show that children and their carers are genetically and ethologically channelled into behaviour to support the small groups in which they live For most of our known global history children have been seen as economic social and status assets to these small groups and their value assessed in proportion to their eventual contribution as adults They are not taught to behave in contributory ways but are absorbed into their need to be useful in terms of all those with whom they associate Cross culturally the growth of individualism and the decline of usefulness of children for their parents have led to pro social behaviour being much reduced to immediate benefits to children and for the small group in which they spend less and less time Teaching children to be useful to an impersonal society in which they have little interest is an industry in modern states Perhaps our conclusion must be that children will only behave in ways that their

society deems correct when they sense on their own that it is profitable to do so The ethical values which have historically maintained the necessary unity of the small group have faded with the growth of survival through secondary employment and state welfare provisions **The Bioarchaeology of Metabolic Bone Disease** Megan B.
