hydrochemical data show that groundwater quality is generally good major solute chemistry varies systematically from recharge to discharge areas and suggest that most groundwater was recharged over one thousand years ago implying low recharge rates and or long or slow flow paths Two aquifer tests yield estimates of transmissivity and storativity for the carbonate rock and basin fill aquifers Variations in the potentiometric surface hydrogeology and hydrochemistry are consistent with the hypothesis of regional groundwater flow from Snake Valley northeast to Tule Valley and Fish Springs Collectively our work delineates groundwater levels flow and chemistry in Snake Valley and adjacent basins to a much greater degree than previously possible and emphasizes the sensitivity of the groundwater system to possible increases in groundwater pumping
