

ZOOL 240 **GENERAL PARASITOLOGY**

Definitions of terms

Different kinds of parasites

Ectoparasite – a parasitic organism that lives on the outer surface of its host, e.g. lice, ticks, mites etc.

- **Endoparasites** – parasites that live inside the body of their host, e.g. *Entamoeba histolytica*.
- **Obligate Parasite** - This parasite is completely dependent on the host during a segment or all of its life cycle, e.g. *Plasmodium* spp.
- **Facultative parasite** – an organism that exhibits both parasitic and non-parasitic modes of living and hence does not absolutely depend on the parasitic way of life, but is capable of adapting to it if placed on a host. E.g. *Naegleria fowleri*
- **Accidental parasite** – when a parasite attacks an unnatural host and survives. E.g. *Hymenolepis diminuta* (rat tapeworm).
- **Erratic parasite** - is one that wanders in to an organ in which it is not usually found. E.g. *Entamoeba histolytica* in the liver or lung of humans.

Different kinds of hosts

- **Definitive host** – a host that harbors a parasite in the adult stage or where the parasite undergoes a sexual method of reproduction.
- **Intermediate host** - harbors the larval stages of the parasite or an asexual cycle of development takes place. In some cases, larval development is completed in two different intermediate hosts, referred to as first and second intermediate hosts.
- **Paratenic host** – a host that serves as a temporary refuge and vehicle for reaching an obligatory host, usually the definitive host, i.e. it is not necessary for the completion of the parasites life cycle.
- **Reservoir host** – a host that makes the parasite available for the transmission to another host and is usually not affected by the infection.
- **Natural host** – a host that is naturally infected with certain species of parasite.
- **Accidental host** – a host that is under normal circumstances not infected with the parasite.

Infective stage- is the stage of the life cycle of a parasite capable of producing an infection on the host e.g. sporozoites are infective stages of plasmodium, promastigotes infective stage of leishmania etc.

Autoinfection- is reinfection of oneself by a stage of the parasite while still in the body of the host

Zoonosis- are parasitic infections common to both humans and animals and are transmissible from one to another.

Vector- is restricted to intermediate/final host which actively transmit parasite from one host to another e.g. mosquito is a vector of plasmodium parasite causing malaria

Host-parasite relationships

There is a dynamic equilibrium which exists in the interaction of organisms. Any organism that spends a portion or all of its life cycle intimately associated with another organism of a different species is considered as Symbiont (symbiote) and this relationship is called symbiosis (symbiotic relationships). The following are the three common symbiotic relationships between two organisms:
