

Numerical Weather Forecast Model

$$u_j^{n+1} = u_j^n - \Delta t \times u_j^n \left(\frac{u_{j+1}^n - u_{j-1}^n}{2\Delta x} \right), j = 1, 2, \dots, N$$

When $n = 0$, $u_j^1 = u_j^0 - \Delta t \times u_j^0 \frac{u_{j+1}^0 - u_{j-1}^0}{2\Delta x}$, We need u^0 ($n = 0$) as initial conditions (IC) to get u^1 .

When $j = 2$, $u_2^1 = u_2^0 - \Delta t \times u_2^0 \frac{u_3^0 - u_1^0}{2\Delta x}$, where u_1^0 (and u_N^0) is at the edge of the domain.

We need specify boundary conditions (BC) for $j = 1$ and N .

Numerical Methods In Weather Prediction:

Numerical Methods in Weather Prediction G Marchuk, 2012-12-02 Numerical Methods in Weather Prediction focuses on the numerical methods for solving problems of weather prediction and explains the aspect of the general circulation of the atmosphere. This book explores the development in the science of meteorology which provides investigators with improved means of studying physical processes by mathematical stimulation. Organized into eight chapters, this book starts with an overview of the significant physical factors that are instrumental in enriching the theoretical models of weather prediction. This text then examines the system of hydrodynamic equations and the equation of heat transfer related to large scale atmospheric processes. Other chapters consider the quasigeostrophic approximation model which is the basis for concepts of the dynamics of atmospheric motions and instrumental in establishing the basic features and laws of evolution of meteorological variables as applied to large scale processes. The final chapter deals with the adjustment of the humidity field. This book is a valuable resource for meteorologists.

Weather Prediction by Numerical Process Lewis Fry Richardson, 2007-08-13 New edition of a classic book which was the first comprehensive description of numerical weather prediction.

An Introduction to Numerical Weather Prediction Techniques T. N. Krishnamurti, Lahouari Bounoua, 2018-05-11 An Introduction to Numerical Weather Prediction Techniques is unique in the meteorological field as it presents for the first time theories and software of complex dynamical and physical processes required for numerical modeling. It was first prepared as a manual for the training of the World Meteorological Organization's programs at a similar level. This new book updates these exercises and also includes the latest data sets. This book covers important aspects of numerical weather prediction techniques required at an introductory level. These techniques ranging from simple one dimensional space derivative to complex numerical models are first described in theory and for most cases supported by fully tested computational software. The text discusses the fundamental physical parameterizations needed in numerical weather models such as cumulus convection radiative transfers and surface energy fluxes calculations. The book gives the user all the necessary elements to build a numerical model. An Introduction to Numerical Weather Prediction Techniques is rich in illustrations especially tables showing outputs from each individual algorithm presented. Selected figures using actual meteorological data are also used. This book is primarily intended for senior level undergraduates and first year graduate students in meteorology. It is also excellent for individual scientists who wish to use the book for self study. Scientists dealing with geophysical data analysis or predictive models will find this book filled with useful techniques and data processing algorithms.
