

Management of perinatal cervical spine injury using custom-fabricated external orthoses: design considerations, narrative literature review, and experience from the Hospital for Sick Children. Illustrative cases

BACKGROUND Cervical spine injuries in neonates are rare and no guidelines are available to inform management. The most common etiology of neonatal cervical injury is birth-related trauma. Management strategies that are routine in older children and adults are not feasible due to the unique anatomy of neonates.

OBSERVATIONS Here, the authors present 3 cases of neonatal cervical spinal injury due to confirmed or suspected birth trauma, 2 of whom presented immediately after birth, while the other was diagnosed at 7 weeks of age. One child presented with neurological deficits due to spinal cord injury, while another had an underlying predisposition to bony injury, infantile malignant osteopetrosis. The children were treated with a custom-designed and manufactured full-body external orthoses with good clinical and radiographic outcomes. A narrative literature review further supplements this case series and highlights risk factors and the spectrum of birth-related spinal injuries reported to date.

LESSONS The current report highlights the importance of recognizing the rare occurrence of cervical spinal injury in newborns and provides pragmatic recommendations for management of these injuries. Custom orthoses provide an alternate option for neonates who cannot be fitted in halo vests and who would outgrow traditional casts.

KEYWORDS cervical spine injury; orthoses; neonate

Neonatal spine injury is rare, with an estimated incidence of 1 case per 29,000.¹ Furthermore, injury to the spinal cord was identified in 10% of perinatal neonatal deaths or stillbirths at autopsy.² Birth-related spinal cord injury (SCI) is thought to occur secondary to excessive extraction, rotation, or hyperextension of the neck during delivery; as such, shoulder dystocia, breech position, and forceps or vacuum assistance have emerged as risk factors for neonatal SCI. The clinical manifestation of SCI in this population can be significant, with a ranging spectrum of sensorimotor deficits and sometimes apnea, necessitating ventilation.¹ Neonates are at higher risk of upper cervical spine injuries because of underdeveloped muscles and ligaments, relative craniocervical size mismatch, and incomplete mineralization of the vertebrae.³ Based on existing

literature, the prognosis of birth-related SCI in neonates is poor, with a high mortality rate and long-term neurological morbidity among surviving patients.^{1,4,5}

SCI in the pediatric population can be classified based on the radiographic appearance: fracture, fracture with subluxation, subluxation alone, and SCI without radiographic abnormality.⁶ Treatment is centered around providing appropriate immobilization, reduction, and stabilization in order to achieve spinal stability while mitigating permanent neurological deficits and long-term sequelae, including joint contractures, fractures, and scoliosis.^{7,8} Current treatment modalities include surgical stabilization and external immobilization systems.⁹ Surgery is particularly challenging in newborns due to their unique anatomy, the potential impact on growth, and difficulty achieving adequate

ABBREVIATIONS CT = computed tomography; MRI = magnetic resonance imaging; OTS = off-the-shelf; SCI = spinal cord injury.

Song,Peter Ventevogel,2020-06-15 More than half of the 25.9 million refugees in the world are under the age of 18 and the mental health of these children and adolescents constitutes a growing global public health priority Refugee children and their families are at increased risk to develop mental health problems but they often face major challenges in accessing adequate treatment and mental health professionals frequently feel ill equipped to assist this group Refugees are faced with a plethora of issues including the ambiguous loss of loved ones psychological trauma related to past experiences of violence

and atrocities the complexities of daily life as a refugee and the challenges to adapt to new systems of care and support. Refugees' life circumstances all too often undermine their agency as they face discrimination, stigma, and social isolation or exclusion. Refugees are frequently disconnected from the usual family and community supports that they once had, which creates additional mental distress. As parents struggle with these changes, their children often find it even more difficult to adapt and connect with them. This all leads to increased prevalence of mental health conditions among refugees.

Humanitarian policies recommend family-centered interventions that are multi-sectoral, multi-disciplinary, and focus on optimizing resource utilization. Over the last decade, a considerable body of research has emerged around socio-ecological models of mental health, family and community approaches, and resilience and strengths-based theories, but these insights are insufficiently incorporated in the practice of mental health care for refugee children. Clinicians often struggle to grasp the common, unique stressors that families face and are not familiar with working with families as units for intervention. Using culturally and contextually informed assessment methods and family-oriented management approaches not only help individual children or adolescents but also their families. This book aims to provide an overview of the latest theoretical insights from research on sociocultural aspects of mental health and connect these with clinical insights from practical mental health care provision. Using strengths-based, resiliency-oriented, and family-centered approaches can enrich clinical practice in refugee mental health, but clinicians need to translate the emerging evidence into concrete steps and interventions. This requires additional skills for the assessment and management of mental health conditions in refugee children and families.

The chapters in this book are written by a diverse group of authors using global, multi-disciplinary approaches. The chapters provide examples from various contexts, including refugees who are displaced to neighboring countries, refugees on the move, and refugees and asylum seekers in resettlement settings. This book is therefore a unique resource for clinicians, researchers, and policy makers working on mental health issues of refugee children and adolescents around the world.
