*Cardiovascular Disease in the Elderly* Franz H. Messerli, 2013-12-01 By the time a man gets well into his seventies his continued existence is a mere miracle Robert Louis Stevenson It hardly seems possible that a second edition is needed after the first has been in print for only three years However when I reflect on what has happened in geriatric cardiology during that short period it becomes obvious why First cardiologists all over the globe have begun to realize that geriatric cardiology has evolved into a science and a clinical discipline of its own Although some of us may consider such subspecialization unfortunate it has become clear that a variety of cardiac disorders present with different symptoms and signs require a different diagnostic and therapeutic approach and have a different prognostic outlook in the elderly when compared to middle aged patients Since the aging segment of the population has increased dramatically over the past few decades and continues to do so specific age related disorders are more frequently encountered by the practicing physician be it by the general practitioner by the internist or by a cardiologist *Cardiovascular Disease in the Elderly* provides an up to date guide to help the physician deal with these problems leading the way in what turns out to be an increasingly complex area Second I have been heartened by the warm reception of the first edition and by the excellent reviews that it got in the most prestigious medical journals

Manual of Nonpharmacological Control of Hypertension J.R. Viskoper, 2012-12-06 The prevention and correction of high blood pressure obviously is not an end in itself but a means of preventing cardiovascular complications It is tempting to resort to antihypertensive drugs for the simple reason that current preparations are easy to dose and to take There is a variety of reasons however to take advantage of the antihypertensive potential of nonpharmacological approaches first For one thing the use of tablets tends to accentuate the negative effects of labelling a subject as hypertensive The act of taking tablets per se may elicit a spectrum of subjective adverse effects as we have learned from placebo controlled therapeutic trials Even more importantly the benefits of antihypertensive drug treatment are largely confined to the reduction of stroke and disease of the large vessels With regard to incidence of cardiac events some modest beneficial effects have been registered such as a decrease in congestive heart failure and in the fatality rate of myocardial infarction The effects on the incidence of coronary heart disease are only marginal at best This disappointing finding has been ascribed to various factors unwanted metabolic effects of anti hypertensive drugs inadvertent drops in diastolic pressure interfering with coronary perfusion and last but not least failure to eliminate risk factors other than high blood pressure smoking alcohol abuse lipid and glucose disturbances obesity and the hemodynamic disadvantages of a sedentary life Most of these additional noxious factors are refractory to drug treatment and call for modification of life style
