Appellate Division Third Department , *Arterial Remodeling: A Critical Factor in Restenosis* Antoine Lafont, Eric J. Topol, 2012-12-06 Angioplasty has completely transformed the treatment of coronary artery disease and is widely used with more than 800 000 procedures performed worldwide per year However the enthusiasm for angioplasty is shadowed by restenosis which remains a critical problem after the procedure resulting in clinical recurrence in over a third of patients Recently the mechanisms of restenosis have been completely reappraised with an enriched understanding that the original concept of neointimal hyperplasia may not be accounting for the bulk of the problem There is a desperate need to heighten understanding of the remodeling process at the molecular cellular and arterial level Vascular remodeling is a well established concept in the field of atherosclerosis and hypertension but only in recent years has its applicability to the field of restenosis become pivotal Accordingly the editors perceived the need to assemble the first book dedicated to the concept of coronary artery remodeling in restenosis in order to clearly review the experiments leading to the remodeling hypothesis and integrate this with the neointimal hyperplasia tumor model for the development of the restenotic lesion The authors of this book present their experience to facilitate the understanding of the mechanisms for coronary restenosis and remodeling The various experimental models clinical issues and basic mechanisms are reviewed in detail resulting in a fresh approach to a vexing clinical problem Arterial Remodeling A Critical Factor in Restenosis will be useful to the physician and trainee who

have an interest in restenosis and specifically in the major pathophysiologic process which determines the fate of arterial healing in patients following percutaneous coronary revascularization. It is hoped that this book will lay the foundation for more effective therapies that will reduce the chance of constrictive remodeling and improve the long term efficacy of non surgical coronary revascularization in the future. Ferroptosis: Intersections, Implications, and Innovations in Programmed Cell Death Patrice X. Petit, Bilal Çiğ, Juan Carlos Mayo, 2025-08-08

Ferroptosis a form of regulated cell death driven by iron dependent lipid peroxidation has emerged as a critical mechanism governing a myriad of pathophysiological conditions Firstly identified in cancer cells the process of ferroptosis has since been implicated in various disease states including neurodegeneration kidney damage cutaneous and cardiovascular diseases The identification and understanding of ferroptosis have revolutionized our perception of cell death and survival unraveling new potential therapeutic targets and strategies Yet despite the progress made crucial gaps in our knowledge persist How exactly does ferroptosis intersect with other types of cell death What are the specific markers and effectors of ferroptosis in different cell types How can we precisely manipulate ferroptosis in cellular models and what

anticipations can we build from such experiments regarding possible therapeutics This Research Topic aims to collect the latest advances in our understanding of ferroptosis and seeks to increase our knowledge of the cellular and molecular machinery behind this form of programmed cell death It will probe into the links between ferroptosis and other forms of cell death its regulation and manipulation for potential therapeutic advantage as well as its role in various pathophysiological conditions
