Kagel, Alvin E. Roth, 2020-05-05 This book which comprises eight chapters presents a comprehensive critical survey of the results and methods of laboratory experiments in economics The first chapter provides an introduction to experimental economics as a whole with the remaining chapters providing surveys by leading practitioners in areas of economics that have seen a concentration of experiments public goods coordination problems bargaining industrial organization asset markets auctions and individual decision making The work aims both to help specialists set an agenda for future research and to provide nonspecialists with a critical review of work completed to date Its focus is on elucidating the role of experimental studies as a progressive research tool so that wherever possible emphasis is on series of experiments that build on one another The contributors to the volume Colin Camerer Charles A Holt John H Kagel John O Ledyard Jack Ochs Alvin E Roth and Shyam Sunder adopt a particular methodological point of view the way to learn how to design and conduct experiments is to consider how good experiments grow organically out of the issues and hypotheses they are designed to investigate *Catalog of Copyright Entries. strong theory and efficient empirical tools that address derivatives fixed income securities mean variance efficient portfolios and the market portfolio The book provides a series of examples to illustrate the theory The second edition continues the tradition of the first edition by being the one and only book to focus completely on how behavioral finance principles affect asset pricing now with its theory deepened and enriched by a plethora of research since the first edition Handbook of Experimental Economic Methodology Guillaume R. Fréchette, Andrew Schotter, 2015-01-02 The Handbook of Experimental Economic Methodology edited by Guillaume R Fr chette and Andrew Schotter aims to confront and debate the issues faced by the growing field of experimental economics For example as experimental work attempts to test theory it raises questions about the proper relationship between theory and experiments As experimental results are used to inform policy the utility of these results outside the lab is questioned and finally as experimental economics tries to integrate ideas from other disciplines like psychology and neuroscience the question of their proper place in the discipline of economics becomes less clear This book contains papers written by some of the most accomplished scholars working at the intersection of experimental behavioral and theoretical economics talking about methodology It is divided into four sections each of which features a set of papers and a set of comments on those papers The intention of the volume is to offer a place where ideas about methodology could be discussed and even argued Some of the papers are contentious a healthy sign of a dynamic discipline while others lay out a vision for how the authors think experimental economics should be pursued This exciting and illuminating collection of papers brings light to a topic at the core of experimental economics Researchers from a broad range of fields will benefit from the exploration of these important questions *Journal of the American Statistical Association* ,1992 A scientific and educational journal not only for professional statisticians but also for economists business executives research directors government officials university professors and others who are seriously interested in the application of statistical methods to practical problems in the development of more useful methods and in the improvement of basic statistical data Diversity of Experimental Methods in Economics Toshiji Kawagoe, Hirokazu Takizawa, 2019-02-09 This is the first book that examines the diverse range of experimental methods currently being used in the social sciences gathering contributions by working economists engaged in experimentation as well as by a political scientist psychologists and philosophers of the social sciences Until the mid twentieth century most economists believed that experiments in the economic sciences were impossible But that s hardly the case today as evinced by the fact that Vernon Smith an experimental economist and Daniel Kahneman a behavioral economist won the Nobel Prize in Economics in 2002 However the current use of experimental methods in economics is more diverse than is usually assumed As the concept of experimentation underwent considerable abstraction throughout the twentieth century the areas of the social sciences in which experiments are applied are expanding creating renewed interest in and multifaceted debates on the way experimental methods are used This book sheds new light on the diversity of experimental methodologies used in the social sciences The topics covered include

historical insights into the evolution of experimental methods the necessary performativity of experiments i e the dynamic interaction with the social contexts in which they are embedded the application of causal inferences in the social sciences a comparison of laboratory field and natural experiments and the recent use of randomized controlled trials RCTs in development economics Several chapters also deal with the latest heated debates such as those concerning the use of the random lottery method in laboratory experiments

[Handbook of Experimental Economics Results](#) Charles R. Plott, Vernon L. Smith, 2008-08-21 Experimental methods in economics respond to circumstances that are not completely dictated by accepted theory or outstanding problems While the field of economics makes sharp distinctions and produces precise theory the work of experimental economics sometimes appear blurred and may produce results that vary from strong support to little or partial support of the relevant theory At a recent conference a question was asked about where experimental methods might be more useful than field methods Although many cannot be answered by experimental methods there are questions that can only be answered by experiments Much of the progress of experimental methods involves the posing of old or new questions in a way that experimental methods can be applied The title of the book reflects the spirit of adventure that experimentalists share and focuses on experiments in general rather than forcing an organization into traditional categories that do not fit The emphasis reflects the fact that the results do not necessarily demonstrate a consistent theme but instead reflect bits and pieces of progress as opportunities to pose questions become recognized This book is a result of an invitation sent from the editors to a broad range of experimenters asking them to write brief notes describing specific experimental results The challenge was to produce pictures and tables that were self contained so the reader could understand quickly the essential nature of the experiments and the results

Attention, predictions and

expectations, and their violation: attentional control in the human brain Simone Vossel, Joy J. Geng, Karl J. Friston, 2015-05-20

In the burdened scenes of everyday life our brains must select from among many competing inputs for perceptual synthesis so that only the most relevant receive full attention and irrelevant distracting information is suppressed. At the same time we must remain responsive to salient events outside our current focus of attention and balancing these two processing modes is a fundamental task our brain constantly needs to solve. Both the physical saliency of a stimulus as well as top down predictions about imminent sensations crucially influence attentional selection and consequently the response to unexpected events. Research over recent decades has identified two separate brain networks involved in predictive top down control and reorientation to unattended events or oddball stimuli: the dorsal and ventral fronto-parietal attention systems of the human brain. Moreover, specific electrophysiological brain responses are known to characterize attentional orienting as well as the processing of deviant stimuli. However, many key questions are outstanding. What are the exact functional differences between these cortical attention systems? How are they lateralised in the two hemispheres? How do top down and bottom up signals interact to enable flexible attentional control? How does structural damage to one system affect the functionality of the other in brain damaged patients? Are there sensory specific and supra-modal attentional systems in the brain? In addition to these questions, it is now accepted that brain responses are not only affected by the saliency of external stimuli but also by our expectations about sensory inputs. How these two influences are balanced and how predictions are formed in cortical networks or generated on the basis of experience-dependent learning are intriguing issues. In this Research Topic we aim to collect innovative contributions that shed further light on the cortical mechanisms of attentional control in the human brain. In particular, we would like to encourage submissions that investigate the behavioural correlates, functional anatomy or electrophysiological markers of attentional selection and reorientation. Special emphasis will be given to studies investigating the context sensitivity of these attentional processes in relation to prior expectations, trial history, contextual cues or physical saliency. We would like to encourage submissions employing different research methods: psychophysical recordings, neuroimaging techniques such as fMRI, MEG, EEG or ECoG as well as neurostimulation methods such as TMS or tDCS in healthy volunteers or neurological patients. Computational models and animal studies are also welcome. Finally, we also welcome submission of meta-analyses and reviews. Articles that provide new insights into or conclusions about recent work in the field.

Experimental Economics Nicholas Bardsley, Robin Cubitt, Graham Loomes, Peter Moffatt, Chris Starmer, Robert Sugden, 2020-05-26

Since the 1980s there has been explosive growth in the use of experimental methods in economics leading to exciting developments in economic theory and policy. Despite this, the status of experimental economics remains controversial. In *Experimental Economics* the authors draw on their experience and expertise in experimental economics, economic theory, the methodology of economics, philosophy of science and the econometrics of experimental data to offer a balanced and integrated look at the nature and reliability of claims based on experimental research. The authors explore the

history of experiments in economics provide examples of different types of experiments and show that the growing use of experimental methods is transforming economics into a genuinely empirical science They explain that progress is being held back by an uncritical acceptance of folk wisdom regarding how experiments should be conducted a failure to acknowledge that different objectives call for different approaches to experimental design and a misplaced assumption that principles of good practice in theoretical modeling can be transferred directly to experimental design Experimental Economics debates how such limitations might be overcome and will interest practicing experimental economists nonexperimental economists wanting to interpret experimental research and philosophers of science concerned with the status of knowledge claims in economics
