Loss of Biodiversity Rachael Hames, 2017-12-15 Biodiversity is the foundation for maintaining the balance between all living things When species begin dying out it upsets this delicate balance and can cause ecological tragedies Earth's rainforests are homes to vast biodiversity However the rainforests are also one of Earth's most threatened habitats There animals risk losing their homes through pollution and deforestation The information presented in this book highlights at risk animal and plant species and discusses ways readers can lessen their carbon footprint Colorful photographs of animals and habitats transport readers to distant locations where biodiversity takes center stage

Biodiversity Offsets Wolfgang Wende, Graham - M. Tucker, Fabien Quétier, Matt Rayment, Marianne Darbi, 2018-03-07 This book deals with the new concept of biodiversity offsets The aim of offsetting schemes is to achieve no net loss or even net gain of biodiversity Offsets obey a mitigation hierarchy and reflect the precautionary and polluter pays principle in regard to project impacts Readers gain insights into current debates on biodiversity policies with top experts outlining theoretical principles and the latest research findings At the same time the focus is on practical application and case studies Today there is a lively international discussion among practitioners and scientists on the optimal legal framework metrics and design of habitat banks to ensure the success of biodiversity offsets and to minimise the risks of failure or misuse Contributing to the debate this volume presents the activities and practices of biodiversity offsetting already implemented in Europe in selected EU member states and the lessons that can be learnt from them Readers may be surprised at how much experience already exists in these countries A further aim of the book is to offer grounded insights on the road ahead and foster a more intensive and fruitful discussion on how offsetting can be extended

and improved upon so that it becomes a key and effective component of Europe's biodiversity conservation policy framework

Biodiversity Loss Charles Perrings, 1997-01-28 This volume reports key findings of the Biodiversity Program of the Royal Swedish Academy of Sciences Beijer Institute. The program brought together a number of eminent ecologists and economists to consider the nature and significance of the biodiversity problem. In encouraging collaborative work between these closely related disciplines it sought to shed new light on the concept of diversity, the implications of biological diversity for the functioning of ecosystems, the driving forces behind biodiversity loss, and the options for promoting biodiversity conservation. The results of the program are surprising. It is shown that the core of the biodiversity problem is a loss of ecosystem resilience and the insurance it provides against the uncertain environmental effects of economic and population growth. This is as much a local as a global problem, implying that biodiversity conservation offers benefits that are as much local as global. The solutions as well as the causes of biodiversity loss lie in incentives to local users.

Biodiversity and Conservation: Causes and consequences of biodiversity loss 2 : pollution, climate change and unsustainable exploitation

Richard J. Ladle, 2009 Although biodiversity is a relatively new coinage, scientists have been studying the subject it describes long before the word's first appearance in the language in the mid 1980s. In 1973, for instance, the UK Systematics Association held a symposium on The Changing Flora and Fauna of Britain which concluded that not enough attention was being paid to the conservation of rarities. A conclusion also reached said the symposium at a meeting of the Linnean Society some forty years earlier. By 1980 the Global 2000 Report to the President published by the US Council on Environmental Quality starkly warned of a diminution of up to one fifth of all species by the turn of the century and there is now a growing consensus that the world faces a biodiversity crisis, a potentially catastrophic global loss of genetic ecosystem and most obviously species diversity. Indeed, especially since the UN Convention on Biological Diversity was promulgated in Rio de Janeiro in 1992, conserving biodiversity has become the principal focus of the global conservation movement. Indeed, the study of the origins, maintenance, and protection of diversity has become perhaps the most vibrant offshoot of ecology and conservation studies. It is increasingly taught and studied in universities and other research institutions around the world. Addressing the need for an authoritative reference work to make sense of this rapidly growing subject and its ever more complex and multidisciplinary corpus of scholarly literature, Biodiversity and Conservation is a new title in the Routledge series Critical Concepts in the Environment. Edited by Richard Ladle of Oxford University's Centre for the Environment, this new Major Work brings together in five volumes the foundational and the very best cutting edge scholarship to provide a synoptic view of all the key issues and current debates.
