Numerical Solution of Time-Dependent Advection-Diffusion-Reaction Equations Willem Hundsdorfer,Jan G. Verwer,2013-04-17 This book deals with numerical methods for solving partial differential equa tions PDEs coupling advection diffusion and reaction terms with a focus on time dependency A combined treatment is presented of methods for hy perbolic problems thereby emphasizing the one way wave equation meth ods for parabolic problems and methods for stiff and non stiff ordinary dif ferential equations ODEs With regard to time dependency we have at tempted to present the algorithms and the discussion of their properties for the three different types of differential equations in a unified way by using semi discretizations i e the method of lines whereby the PDE is trans formed into an ODE by a suitable spatial discretization In addition for hy perbolic problems we also discuss discretizations that use information based on characteristics Due to this combination of methods this book differs substantially from more specialized textbooks that deal exclusively with nu merical methods for either PDEs or ODEs We treat integration methods suitable for both classes of problems This combined treatment offers a clear advantage On the one hand in the field of numerical ODEs highly valuable methods and results exist which are of practical use for solving time dependent PDEs something which is often not fully exploited by numerical PDE researchers Although many problems can be solved by Euler s method or the Crank Nicolson method better alter natives are often available which can significantly reduce the computational effort needed to solve practical problems **Flux-Corrected Transport** Dmitri Kuzmin,Rainald Löhner,Stefan Turek,2012-03-30 Addressing students and researchers as well as Computational Fluid Dynamics practitioners this book is the most comprehensive review of high resolution schemes based on the principle of Flux Corrected Transport FCT The foreword by J P Boris and historical note by D L Book describe the development of the classical FCT methodology for convection dominated transport problems while the design philosophy behind modern FCT schemes is explained by S T Zalesak The subsequent chapters present various improvements and generalizations proposed over the past three decades In this new edition recent results are integrated into existing chapters in order to describe significant advances since the publication of the first edition Also 3 new chapters were added in order to cover the following topics algebraic flux correction for finite elements iterative and linearized FCT schemes TVD like flux limiters acceleration of explicit and implicit solvers mesh adaptation failsafe limiting for systems of conservation laws flux corrected interpolation remapping positivity preservation in RANS turbulence models and the use of FCT as an implicit subgrid scale model for large eddy simulations Fractional Differential Equations Angelamaria Cardone,Marco Donatelli,Fabio Durastante,Roberto Garrappa,Mariarosa Mazza,Marina Popolizio,2023-06-16 The content of the book collects some contributions related to the talks presented during the INdAM Workshop Fractional Differential Equations Modelling Discretization and Numerical Solvers held in Rome Italy on July 12 14 2021 All contributions are original and not published elsewhere The main topic of the book is fractional calculus a topic that

addresses the study and application of integrals and derivatives of noninteger order These operators unlike the classic operators of integer order are nonlocal operators and are better suited to describe phenomena with memory with respect to time and or space Although the basic ideas of fractional calculus go back over three centuries only in recent decades there has been a rapid increase in interest in this field of research due not only to the increasing use of fractional calculus in applications in biology physics engineering probability etc but also thanks to the availability of new and more powerful numerical tools that allow for an efficient solution of problems that until a few years ago appeared unsolvable The analytical solution of fractional differential equations FDEs appears even more difficult than in the integer case Hence numerical analysis plays a decisive role since practically every type of application of fractional calculus requires adequate numerical tools The aim of this book is therefore to collect and spread ideas mainly coming from the two communities of numerical analysts operating in this field the one working on methods for the solution of differential problems and the one working on the numerical linear algebra side to share knowledge and create synergies At the same time the book intends to realize a direct bridge between researchers working on applications and numerical analysts Indeed the book collects papers on applications numerical methods for differential problems of fractional order and related aspects in numerical linear algebra The target audience of the book is scholars interested in recent advancements in fractional calculus **Multicomponent and Multiscale Systems** Juergen Geiser,2015-08-21 This book examines the latest research results from combined multi component and multi scale explorations It provides theory considers underlying numerical methods and presents brilliant computational experimentation Engineering computations featured in this monograph further offer particular interest to many researchers engineers and computational scientists working in frontier modeling and applications of multicomponent and multiscale problems Professor Geiser gives specific attention to the aspects of decomposing and splitting delicate structures and controlling decomposition and the rationale behind many important applications of multi component and multi scale analysis Multicomponent and Multiscale Systems Theory Methods and Applications in Engineering also considers the question of why iterative methods can be powerful and more appropriate for well balanced multiscale and multicomponent coupled nonlinear problems The book is ideal for engineers and scientists working in theoretical and applied areas
