

STATE PARK HIGHLIGHTS BY REGION

The 359 imperiled animal species, rare plant species, and significant natural community types known in the state park system are distributed across the state according to the availability of habitat, so boreal species, for example, are typically restricted to northerly regions while Midwestern species are mostly in western New York. Despite this patchy distribution, however, the numbers of rare species and natural community types in each region consistently range between about five and 20 (Figure 3). The Long Island and Palisades Regions, however, are dramatically more diverse.

While exploring the reasons for the variation in the Long Island and Palisades Regions was beyond the scope of this project, we surmise that several factors may be behind it. First, many of New York's rare species and unusual natural community types are maritime, and these species and communities are restricted to Long Island. Second, the Long Island and Palisades Regions may capture species and natural community types (such as tiger salamanders – *Ambystoma tigrinum*) that are reaching the northern extent of their ranges. Third, these regions include several geologically unusual areas, particularly the Long Island moraine and the Shawangunk Ridge, which create uncommon habitats. Finally, the Palisades Region includes several of the state's largest parks – Harriman, Sterling Forest®, and Minnewaska – and greater area increases the likelihood of having a rare species or significant natural community present. A final factor that may or may not hold up under analysis is that the Long Island and Palisades Regions have undergone some of the most intensive development in the state, which may have given them a disproportionate number of species that were once common but are now rare.

While the Long Island and Palisades Regions have particularly high biodiversity, every region (Figure 2) has something that makes it distinctive and important. We briefly summarize some of these notable features in the following pages.

Figure 3. Distribution of Rare Species and Significant Natural Community Types within State Park Regions. The number of rare species and significant natural community types are distributed relatively uniformly across the state parks regions with the exceptions of the Long Island and Palisades Regions. The low numbers in the Adirondack and Catskill Region are probably due to most state lands there being in the forest preserve, not state park, system.
