

DEADLOCK AVOIDANCE

- Deadlock avoidance is a proactive approach that uses algorithms to determine if a deadlock is about to occur and takes measures to prevent it.
- There are two main approaches to deadlock avoidance:
 - 1. The banker's algorithm:** This is a resource-allocation algorithm that ensures that a deadlock will never occur by keeping track of the resources currently being held by each process and ensuring that a new resource allocation request can be safely granted.
 - 2. The wait-for graph:** This approach involves constructing a graph that represents the relationships between processes and resources, and checking the graph for cycles to determine whether a deadlock is likely to occur. If a cycle is detected, the request for a new resource allocation is rejected, preventing the deadlock.
