planets the sun the moon and satellites using a personal computer and high school mathematics for amateur astronomers Our knowledge of the universe is expanding rapidly as space probes launched decades ago begin to send information back to earth There has never been a better time to learn about how planets stars and satellites move through the heavens This book is for amateur astronomers who want to move beyond pictures of constellations in star guides and solve the mysteries of a starry night It is a book for readers who have wondered where Saturn will appear in the night sky when the sun will rise and set or how long the space station will be over their location In *Celestial Calculations* J L Lawrence shows readers how to find the answers to these and other astronomy questions with only a personal computer and high school math Using an easy to follow step by step approach Lawrence explains what calculations are required why they are needed and how they all fit together Lawrence begins with basic principles unit of measure conversions time conversions and coordinate systems He combines these concepts into a computer program that can calculate the location of a star and uses the same methods for predicting the locations of the sun moon and planets He then shows how to use these methods for locating the many satellites we have sent into orbit Finally he describes a variety of resources and tools available to the amateur astronomer including star charts and astronomical tables Diagrams illustrate the major concepts and computer programs that implement the algorithms are included Photographs of actual celestial objects accompany the text and interesting astronomical facts are interspersed throughout Source code in Python 3 JAVA and Visual Basic and executables for all the programs and examples presented in the book are available for download at <https://CelestialCalculations.github.io>

The Haunted Observatory

Richard Baum, 2007-06-05 For many centuries observers of the night sky interpreted the moving planets and the surrounding starry realms in terms of concentric crystalline spheres in the center of which hung the Earth the hub of creation But with the discoveries of Galileo Copernicus Kepler and Newton astronomers were suddenly struck by a momentous truth the solar system was neither small nor intimate but extended an unfathomable distance toward countless even more distant stars The endless possibilities of these astounding developments fired scientists imaginations leading both to further discoveries and to flights of fancy While newly discovered facts are important and interesting the quaint curiosities and spectral ghosts that led scientists astray have a fascination of their own This is the subject of astronomer Richard Baum in this elegant narrative about the mysteries and wonders of celestial exploration The fabled mountains of Venus a city in the moon ghostly rings around Uranus and Neptune bright inexplicable objects seen near the sun and the truth behind Coleridge's Star dogged Moon in his famous poem about the Ancient Mariner these are just some of the intriguing twists and turns that astronomers took while investigating our starry neighbors Baum vividly conveys the romance of astronomy at a time when the vistas of outer space were a new frontier and astronomers guided only by imagination and analogy set forth on uncharted seas and were haunted for a lifetime by marvels both seen and imagined
