this year's conference was Sustainable Data Driven and Evidence Based Decision Support. The 15 papers presented in this volume were carefully reviewed and selected from 71 submissions. They were organized in topical sections named: decision support systems for a sustainable society, decision support systems serving the public, decision support systems in management and organization, and advances in decision support systems technologies and methods. The EWG DSS series of International Conference on Decision Support System Technology (ICDSST) starting with ICDSST 2015 in Belgrade were planned to consolidate the tradition of annual events organized by the EWG DSS in offering a platform for European and international DSS communities comprising the academic and industrial sectors to present state of the art DSS research and developments, to discuss current challenges that surround decision making processes, to exchange ideas about realistic and innovative solutions, and to co-develop potential business opportunities.

Numerical Modelling of Hydrodynamics for Water Resources Pilar Garcia Navarro, Enrique Playán, 2007-11-01 Overland flow modelling has been an active field of research for some years, but developments in numerical methods and computational resources have recently accelerated progress, producing models for different geometries and types of flows, such as simulations of canal and river networks. Flow in canals has traditionally been described using one-dimensional depth-averaged shallow water models, but a variety of simulation techniques now facilitate the management of hydrodynamic systems, providing models which incorporate complex geometry and diverse flows. Much effort has gone into elaborating canal operational rules based on decision support systems, with the dual aim of assuring water delivery and meeting flow control constraints. In natural water courses, water management problems are associated with the need to meet quality standards. Numerical modelling of advection-diffusion can be used to manage problems related to the movement of solutes in rivers and aquifers. The analysis of solute transport is used to safeguard the quality of surface and ground water and to help prevent eutrophication. Solute flow through the soil can be dynamically linked to overland flow for hydrological and agricultural applications. Advances in modelling also cast new light on sediment transport in rivers, exploring the complex dynamics of river bed erosion and deposition, and assist in the analysis of river reservoir systems. All these issues are discussed in *Numerical Modelling of Hydrodynamics for Water Resources*, which will be useful to civil engineers, applied mathematicians, hydrologists, and physicists.

Practical Hydroinformatics Robert J. Abrahart, Linda M. See, Dimitri P. Solomatine, 2008-10-24 Hydroinformatics is an emerging subject that is expected to gather speed, momentum, and critical mass throughout the forthcoming decades of the 21st century. This book provides a broad account of numerous advances in that field, a rapidly developing discipline covering the application of information and communication technologies, modelling, and computational intelligence in aquatic environments. A systematic survey, classified according to the methods used: neural networks, fuzzy logic, and evolutionary optimization, in particular, is offered together with illustrated practical applications for solving various water-related issues.
