Martens Sables And Fishers Biology And Conservation:

Biology and Conservation of Martens, Sables, and Fishers Keith B. Aubry, William J. Zielinski, Martin G. Raphael, Gilbert Proulx, Steven W. Buskirk, 2012-08-28 Mammals in the genus *Martes* are mid sized carnivores of great importance to forest ecosystems This book the successor to *Martens Sables and Fishers Biology and Conservation* provides a scientific basis for management and conservation efforts designed to maintain or enhance the populations and habitats of *Martes* species throughout the world The twenty synthesis chapters contained in this book bring together the perspectives and expertise of 63 scientists from twelve countries and are organized by the five key themes of evolution and biogeography population biology and management habitat ecology and management research techniques and conservation Recent developments in research technologies such as modeling and genetics biological knowledge about pathogens and parasites and concerns about the potential effects of global warming on the distribution and status of *Martes* populations make new syntheses of these areas especially timely The volume provides an overview of what is known while clarifying initiatives for future research and conservation priorities and will be of interest to mammalogists resource managers applied ecologists and conservation biologists

Martens, Sables, and Fishers Steven Buskirk, 1994 The genus *Martes* includes some of the shiest and most elegant carnivores in the world the martens sables and fishers Highly dependent on wilderness habitat and vulnerable to human encroachment and to overharvesting for their valuable fur they symbolize the natural character of our remaining forests The fisher and the American marten are strongly implicated in the conservation of late successional forests in North American and have been equated with the northern spotted owl *Martens Sables and Fishers* is the first comprehensive treatment of this commercially and biologically important group Thirty chapters written by specialists from eight countries range from theoretical to empirical from reports of original data to unique reviews and syntheses of previous data With coverage that spans the Northern Hemisphere the book offers information on evolution and biogeography population ecology and management conservation habitat ecology and management and physiology and reproduction Addressing global issues about conservation wildlife management and taxonomy *Martens Sables and Fishers* will be a valuable reference for zoologists wildlife biologists natural resource managers ecologists biogeographers foresters and evolutionary biologists Steven W Buskirk is Associate Professor of Zoology and Physiology at the University of Wyoming Alton S Harestad is Associate Professor of Biology at Simon Fraser University Martin G Raphael is Research Wildlife Biologist with the U S D A Forest Service Roger A Pwell is Associate Professor of Zoology at North Carolina State University Raleigh

Martens, Sables, and Fishers Marie Oliver, 2014 *Martens sables and fishers* are midsized carnivores belonging to the genus *Martes* Their silky coats have been valued in the fur trade for centuries which has contributed to a marked decline in their numbers Pacific Northwest *Martes* species depend on structurally complex forested ecosystems and specific climatic conditions for their existence The marten is designated as a Management Indicator Species on many national forests in

Washington Oregon and California The fisher *M. pennanti* is a Management Indicator Species in California and a candidate for listing as a federally endangered species throughout the Pacific Coast states A new comprehensive synthesis provides the scientific foundation for management and conservation efforts designed to maintain or enhance populations and habitats of Martes species throughout the world The book titled *Biology and Conservation of Martens Sables and Fishers A New Synthesis* includes 20 chapters that present the interdisciplinary perspectives of 63 scientists from 12 countries organized around five key themes evolution and biogeography population biology and management habitat ecology and management research techniques and conservation The synthesis covers recent developments in research technologies such as occupancy modeling and genetics biological knowledge about pathogens and parasites and concerns about the potential effects of global warming on the distribution and status of Martes populations

Martens and Fishers (Martes) in Human-Altered Environments Daniel J. Harrison, Angela K. Fuller, Gilbert Proulx, 2006-02-28 Martens and Fishers Martes in Human Altered Environments An International Perspective examines the conditions where humans and martens are compatible and incompatible and promotes land use practices that allow Martes to be representatively distributed and viable All Martes have been documented to use forested habitats and 6 species excluding the stone marten are generally considered to require complex mid to late successional forests throughout much of their geographic ranges All species in the genus require complex horizontal and vertical structure to provide escape cover protection from predators habitat for their prey access to food resources and protection from the elements Martens and the fisher have high metabolic rates have large spatial requirements have high surface area to volume ratios for animals that often inhabit high latitudes and often require among the largest home range areas per unit body weight of any group of mammals Resulting from these unique life history characteristics this genus is particularly sensitive to human influences on their habitats including habitat loss stand scale simplification of forest structure via some forms of logging and landscape scale effects of habitat fragmentation Given their strong associations with structural complexity in forests martens and the fisher are often considered as useful barometers of forest health and have been used as ecological indicators flagship and umbrella species in different parts of the world Thus efforts to successfully conserve and manage martens and fishers are associated with the ecological fates of other forest dependent species and can greatly influence ecosystem integrity within forests that are increasingly shared among wildlife and humans We have made great strides in our fundamental understanding of how animals with these unique life history traits perceive and utilize habitats respond to habitat change and how their populations function and perform under different forms of human management and mismanagement This knowledge enhances our basic understanding of all species of Martes and will help us to achieve the goal of conserving viable populations and representative distributions of the world's Martes their habitats and associated ecological communities in our new millennium

Wildlife Review, 1994 **American Marten, Fisher, Lynx, and Wolverine**, 1995 General Technical Report PNW-GTR, 1997 **Historical Perspective on**

the Reintroduction of the Fisher and American Marten in Wisconsin and Michigan Bronwyn Waller Williams, 2007 Management of mustelid species such as fishers and martens requires an understanding of the history of local populations This is particularly true in areas where populations were extirpated and restored through reintroduction efforts During the late 19th and 20th centuries fishers *Martes pennanti* and American martens *Martes americana* were extirpated from much of their southern range including Michigan and Wisconsin Both species have been restored to varying degrees in these states following multiple reintroductions and translocations We describe the status of the original populations and changes in their status over time and include source locations release sites release and reintroduction dates and demographic characteristics of released animals This synthesis is crucial for evaluating the relative success of reintroductions in Michigan and Wisconsin and combined with knowledge of the current condition of these populations can provide valuable guidance on the future management of these species We also assess the reintroduction of fishers and martens in Michigan and Wisconsin and discuss strategies for successful reintroductions

Wildlife and Landscape Ecology John A. Bissonette, 2012-12-06 Ecologists increasingly recognize the importance of scale in our understanding of nature Landscape ecology in particular emphasizes temporal and spatial scales While research and management of wildlife has traditionally emphasized studies at smaller scales it is now acknowledged that larger landscape level patterns strongly influence demographic processes in wild animal species This book is the first to provide the conceptual basis for learning how larger scale patterns and processes can influence the biology and management of wildlife species It is divided into three sections Underlying Concepts Landscape Metrics Applications and Large Scale Management Wildlife and Landscape Ecology will be welcomed by scientists and managers with interest in and responsibility for the health of wild populations and their role in ecosystems

The Scientific Basis for Conserving Forest Carnivores Leonard F. Ruggiero, 1994 This cooperative effort by USDA Forest Service Research and the National Forest System assesses the state of knowledge related to the conservation status of four forest carnivores in the western United States American marten fisher lynx and wolverine The conservation assessment reviews the biology and ecology of these species It also discusses management considerations stemming from what is known and identifies information needed Overall we found huge knowledge gaps that make it difficult to evaluate the species conservation status
