nutrient dynamics in the soil plant atmosphere continuum New technologies from basic tools like leaf color charts to sophisticated sensor based systems and laser land leveling can reduce the dependency on laboratory assistance and manual labor Another approach concerns the development of crop plants through genetic manipulations that allow them to take up and assimilate nutrients more efficiently as well as identifying processes of plant responses to nutrient deficiency stress and exploring natural genetic variation Though only recently introduced the ability of microbial inoculants to induce NUE is gaining in importance as the loss immobilization release and availability of nutrients are mediated by soil microbial processes

Crop Production Technologies Peeyush Sharma,Vikas Abrol,2012-01-05 Crop production depends on the successful implementation of the soil water and nutrient management technologies Food production by the year 2020 needs to be increased by 50 percent more than the present levels to satisfy the needs of around 8 billion people Much of the increase would have to come from intensification of agricultural production Importance of wise usage of water nutrient management and tillage in the agricultural sector for sustaining agricultural growth and slowing down environmental degradation calls for urgent attention of researchers planners and policy makers Crop models enable researchers to promptly speculate on the long term consequences of changes in agricultural practices In addition cropping systems under different conditions are making it possible to identify the adaptations required to respond to changes This book adopts an interdisciplinary approach and contributes to this new vision Leading authors analyze topics related to crop production technologies The efforts have been made to keep the language as simple as possible keeping in mind the readers of different language origins The emphasis has been on general descriptions and principles of each topic technical details original research work and modeling aspects However the comprehensive journal references in each area should enable the reader to pursue further studies of special interest The subject has been presented through fifteen chapters to clearly specify different topics for convenience of the readers

Nutrient Dynamics for Sustainable Crop Production Ram Swaroop Meena,2019-09-06 The cropping system is one of the important components of sustainable agriculture since it provides more efficient nutrient cycling As such balanced fertilization must be based on the concept of sustainable crop production Feeding the rapidly growing world population using environmentally sustainable production systems is a major challenge especially in developing countries A number of studies have highlighted the fact that degradation of the world s cultivated soils is largely responsible for low and plateauing yields Soil is lost rapidly but only formed over millennia and this represents the greatest global threat to nutrient dynamics in agriculture This means that nutrient management is essential to provide food and nutritional security for current and future generations Nutrient dynamics and soil sustainability imply the maintenance of the desired ecological balance the enhancement and preservation of soil functions and the protection of biodiversity above and below ground Understanding the role of nutrient management as a tool for soil sustainability and nutritional security requires a holistic approach to a wide range of soil parameters biological physical and chemical to assess the soil functions and nutrient dynamics of a crop

Integrated Nutrient Management (INM) in a Sustainable Rice-Wheat Cropping System Anil Mahajan, R. D. Gupta, 2009-05-07 Agriculture is the main occupation in India and about 75% of its population depends directly or indirectly on agriculture for their livelihood It is the dominant sector that contributes 18% of the gross domestic product Thus agriculture is the foundation of the Indian economy The maximum share of Indian exports is also from the agriculture sector As the population of the country is increasing tremendously approximately at the rate of 19 million every year over the existing population of more than 1 billion approximately 1.18 billion the food grain production must necessarily be increased This can be done by increasing crop production to match the population growth rate of 2.2% per annum which is expected to stabilize at 1.53 billion around 2050 There is no doubt that the Green Revolution in India during the late 1960s brought self sufficiency in food grain production mainly through the increase in rice and wheat crop yields the two main crops of the country which play an important role from food security point of view However the excessive use of fertilizers and pesticides and the neglect of organic manures for these crops has resulted in the deterioration of physical chemical and biological health of the rice and wheat growing soils Owing to the deterioration of the health of these soils the productivity of

the rice wheat cropping system has now either got reduced or in some places has become constant for the last decade
