

SOME REMARKS ON QUASI-UNIFORM SPACES

by HANS-PETER A. KÜNZI

(Received 7 July, 1988)

Introduction. A topological space is called a *ugu space* [10] if it admits a unique quasi-uniformity. Answering a question [2, Problem B, p. 45] of P. Fletcher and W. F. Lindgren in the affirmative we show in [8] that a topological space X is a *ugu space* if and only if every interior-preserving open collection of X is finite. (Recall that a collection $\mathcal{C}$ of open sets of a topological space is called *interior-preserving* if the intersection of an arbitrary subcollection of $\mathcal{C}$ is open (see e.g. [2, p. 29]).) The main step in the proof of this result in [8] shows that a topological space in which each interior-preserving open collection is finite is a transitive space. (A topological space is called *transitive* (see e.g. [2, p. 130]) if its fine quasi-uniformity has a base consisting of transitive entourages.) In the first section of this note we prove that each hereditarily compact space is transitive. The result of [8] mentioned above is an immediate consequence of this fact, because, obviously, a topological space in which each interior-preserving open collection is finite is hereditarily compact; see e.g. [2, Theorem 2.36]. Our method of proof also shows that a space is transitive if its fine quasi-uniformity is quasi-pseudo-metrizable. We use this result to prove that the fine quasi-uniformity of a T_1 space X is quasi-metrizable if and only if X is a quasi-metrizable space containing only finitely many nonisolated points. This result should be compared with Proposition 2.34 of [2], which says that the fine quasi-uniformity of a *regular* T_1 space has a countable base if and only if it is a *metrizable* space with only finitely many nonisolated points (see e.g. [11] for related results on uniformities). Another by-product of our investigations is the result that each topological space with a countable network is transitive.

Recently there has been some interest in the construction of *ugu spaces* (compare [4]). In this connection our observation that the product of finitely many *ugu spaces* is a *ugu space* may be useful. We prove this result in the second section of this note. Topological spaces admitting a unique quasi-proximity are called *ugp spaces* in [10]. Each hereditarily compact space is a *ugp space* [10, Theorem 2.4]. Answering a question [2, Problem B, p. 45] of P. Fletcher and W. F. Lindgren in the negative, we show in [6] that a (first-countable) *ugp space* need not be hereditarily compact. In fact, it is proved in [9, Proposition 4] that a *ugp space* X is hereditarily compact if and only if each ultrafilter on X has an irreducible convergence set. (Recall that a nonempty subset A of a topological space is called *irreducible* (see e.g. [9, p. 238]) if each pair of nonempty A -open subsets has a nonempty intersection.) In particular each *ugp Hausdorff space* is hereditarily compact (and, thus, finite) [2, Theorem 2.36]. It seems to be unknown whether the *ugp* T_1 spaces can be characterized in a similar way. The last result contained in this paper shows that, at least, each *ugp* T_1 space with *countable pseudo-character* is hereditarily compact (and, thus, countable). (Recall that a topological space X has *countable pseudo-character* if each point of X is a G_δ -set in X .)
