## **Reninangiotensin System And Progrebion Of Reanl Diseases:**

The Renin-angiotensin System and Progression of Renal Diseases Gunter Wolf,2001-01-01 The renin angiotensin system RAS has long been seen as a systemic endocrine system in which angiotensin II ANG II is solely involved in blood pressure regulation and the mediation of aldosterone release However it is now known that specific organ systems exhibit their own local RAS functioning for the most part independently from their systemic counterpart A deluge of data from the last decade has shown that ANG II displays many more functions than just regulating blood pressure ANG II is a growth factor exhibits profibrogenic actions and even serves as a proinflammatory cytokine It is now clear that this peptide plays a pivotal role in the progression of chronic kidney disease towards endstage renal failure Clinical studies have provided compelling evidence that interference with ANG II slows this deterioration of renal function This publication presents the first comprehensive summary of this important topic Basic concepts as well as clinical aspects of the RAS are reviewed by international experts who made many of the key discoveries that constitute our contemporary understanding of ANG II as a central factor in the progression of renal disease This publication should be read by physicians treating patients with chronic renal diseases internists nephrologists and urologists Moreover basic scientists such as renal physiologists renal pathologists and biochemists who want a comprehensive overview of the subject will profit from reading this book **Renin-Angiotensin**

**System** Anna Tolekova,2017-07-12 Exploring the contractile activity of smooth muscle segments isolated from various organs of healthy animals and animals with experimentally induced diabetes she obtained original data about angiotensin II induced force and time parameters For the first time she established the effect of ghrelin on angiotensin II provoked contraction of the urinary bladder Original data on the role of both types of angiotensin receptors for the contractile activity of the various segments of the gastrointestinal tract and bladder were obtained By applying specific software for force and time parameter analysis the contribution of different types of angiotensin receptors on muscle contractility has been shown The new methodology was used to analyze the data obtained during the registration of smooth muscle relaxation activity which allows the determination of not only the magnitude of the mechanical response but also the parameters related to the time and speed of the contractions Plasma renin activity models have been developed using mathematical approaches to predict the effect of different drug doses on the behavior of the system Blood Pressure Disorders in Acute and Chronic

**Kidney and Blood Pressure Regulation** Hiromichi Suzuki (M.D.),Takao Saruta,2004 Chronic kidney disease is one of the world s major public health problems and the prevalence of kidney failure is rising steadily Among the risk factors for a faster progression of renal disease are hypertension and proteinuria many studies clearly demonstrating that hypertension is both a cause and consequence of chronic kidney disease Namely renal blood pressure regulation seems to be involved in five major pathophysiological mechanisms all closely related to the renin angiotensin system Pressure natriuresis renal sympathetic nervous system renal blood flow intraglomerular pressure and tubuloglomerular feedback This book reviews experimental data which form the basis of our current understanding of the association between hypertension and kidney diseases The pathogenesis of increased blood pressure the mechanisms by which systemic hypertension promotes progressive kidney failure and the impact of antihypertensive agents on experimental renal mechanisms involved in hypertension Furthermore the role of angiotensin II receptor blockers in both the control of systemic blood pressure and the reduction of proteinuria is examined in an attempt to define optimal therapeutic strategies to prevent the otherwise inexorable deterioration of renal function in patients with chronic kidney disease
