Sex Bias in Autoimmunity: From Animal Models to Clinical Research and Applications Coziana Ciurtin,Veena Taneja,Elizabeth C Jury,2023-01-17

Autoimmune diseases are characterized by an abnormal and self directed immune response leading to damage and dysfunction of multiple organs and tissues Most autoimmune diseases are recognized as affecting disproportionately more women than men suggesting a crucial role of sex hormones in modulating immune responses with estrogens being postulated as enhancing autoimmunity and androgens playing a protective role It is also widely acknowledged that there is an overwhelming male bias in non human animal studies of autoimmune diseases while studies of both sexes in human research frequently fail to analyze results by sex Underrepresentation of females in animal models of autoimmune disease is often justified by their intrinsic variability during the reproductive period compromising the understanding of impact of the female sex chromosome and hormones on immune system functions leading to the high prevalence of autoimmune conditions This Research Topic will highlight the most recent advances in understanding the possible mechanisms for sex specific differences in autoimmunity with a specific focus on pre clinical animal and human models of autoimmune inflammation as well as on the most common sex specific differences in autoimmune diseases The topic will emphasize advances in research exploring sex determinants in autoimmune rheumatic diseases such as systemic lupus erythematosus rheumatoid arthritis spondyloarthritis psoriatic arthritis Sj gren s syndrome and further diseases such as inflammatory bowel disease autoimmune hepatitis multiple sclerosis psoriasis asthma and more The present Research Topic will include both full length and short research communications as well as perspective and review articles addressing various aspects of sex biased differences in pathogenesis age at disease onset clinical manifestations disease course treatment response associated co morbidities and overall survival across different autoimmune diseases

Integrated Diagnostics and Biomarker Discovery in Endocrinology and Biomedical Sciences Sijung Yun,Princy Francis,Stephen Wank,2024-12-02 Recent advancements and cost reduction in various omics technologies have provided us with a wealth of data at the molecular cellular and organ levels Other types of comprehensive data sets are also increasingly available at the individual community and population levels The

integration of these different types of data are enabling multidisciplinary convergences in diagnostics and biomarker discovery in various biomedical fields to realize a more holistic systems biology view of diseases Such integrated approaches have also proven useful in the field of endocrinology particularly in better understanding complex heterogeneous diseases such as type 2 diabetes mellitus For instance researchers have combined genotyping data and RNA sequencing data with glycomics and lipidomics to identify potential biomarkers in type 2 diabetes
