Hakeem,Najla Bint Saud Al-Saud,2020-07-08 Healthy environment is important for any kind of biota on earth It provides the  
basic elements of life such as clean water fresh air fertile soil and supports ecosystem of the food chain Pollution drastically  
alters quality of the environment by changing the physico chemical and biological aspects of these components Accordingly  
toxic metals combustible and putrescible substances hazardous wastes explosives and petroleum products are all examples of  
inorganic and organic compounds that cause contaminations Specifically pollution of toxic and heavy metal in the  
environment is a growing problem worldwide currently at an alarming rate Toxic metals threaten the aquatic ecosystems

agriculture and ultimately human health Traditional treatment techniques offer certain advantages such as rapid processing ease of operation and control and flexibility But they could not maintain the quality of the environment due to the high operational costs of chemicals used high energy consumption and handling costs for sludge disposal and overburden of chemical substances which irreversibly affect and destroy biodiversity which ultimately render the soil useless as a medium for plant growth Therefore bioremediation and biotechnology carried out by living assets to clean up stabilize and restore contaminated ecosystems have emerged as promising environmental friendly and affordable approaches Furthermore the use of microbes algae transgenic plants and weeds adapted to stressful environments could be employed to enhance accumulation efficiency Hence sustainable and inexpensive processes are fast emerging as a viable alternative to conventional remediation methods and will be most suitable for developing countries In the current volume we discuss pollution remediation challenges and how living organisms and the latest biotechnological techniques could be helpful in remediating the pollution in ecofriendly and sustainable ways      **Scientific and Technical Aerospace Reports** ,1981
