Number Theory Don Redmond,1996-04-23 This text provides a detailed introduction to number theory demonstrating how other areas of mathematics enter into the study of the properties of natural numbers It contains problem sets within each section and at the end of each chapter to reinforce essential concepts and includes up to date information on divisibility problems polynomial congruence the sums of squares and trigonometric sums Five or more copies may be ordered by college or university bookstores at a special price available on application

Twisted Isospectrality, Homological Wideness, and Isometry Gunther Cornelissen,Norbert Peyerimhoff,2023-05-10 The question of reconstructing a geometric shape from spectra of operators such as the Laplace operator is decades old and an active area of research in mathematics and mathematical physics This book focusses on the case of compact Riemannian manifolds and in particular the question whether one can find finitely many natural operators that determine whether two such manifolds are isometric coverings The methods outlined in the book fit into the tradition of the famous work of Sunada on the construction of isospectral non isometric manifolds and thus do not focus on analytic techniques but rather on algebraic methods in particular the analogy with constructions in number theory methods from representation theory and from algebraic topology The main goal of the book is to present the construction of finitely many twisted Laplace operators whose spectrum determines covering equivalence of two Riemannian manifolds The book has a leisure pace and presents details and examples that are hard to find in the literature concerning fiber products of manifolds and orbifolds the distinction between the spectrum and the spectral zeta function for general operators strong isospectrality twisted Laplacians the action of isometry groups on homology groups monomial structures on group representations geometric and group theoretical realisation of coverings with wreath products as covering groups and class field theory for manifolds The book contains a wealth of worked examples and open problems After perusing the book the reader will have a comfortable working knowledge of the algebraic approach to isospectrality This is an open access book

Constructive Commutative Algebra Ihsen Yengui,2015-12-11 The main goal of this book is to find the constructive content hidden in abstract proofs of concrete theorems in Commutative Algebra especially in well known theorems concerning projective modules over polynomial rings mainly the Quillen Suslin theorem and syzygies of multivariate polynomials with coefficients in a valuation ring Simple and constructive proofs of some results in the theory of projective modules over polynomial rings are also given and light is cast upon recent progress on the Hermite ring and Gr bner ring conjectures New conjectures on unimodular completion arising from our constructive approach to the unimodular completion problem are presented Constructive algebra can be understood as a first preprocessing step for

computer algebra that leads to the discovery of general algorithms even if they are sometimes not efficient From a logical point of view the dynamical evaluation gives a constructive substitute for two highly nonconstructive tools of abstract algebra the Law of Excluded Middle and Zorn's Lemma For instance these tools are required in order to construct the complete prime factorization of an ideal in a Dedekind ring whereas the dynamical method reveals the computational content of this construction These lecture notes follow this dynamical philosophy *Advances in Rings, Modules and Factorizations* Alberto Facchini, Marco Fontana, Alfred Geroldinger, Bruce Olberding, 2020-06-02 Occasioned by the international conference Rings and Factorizations held in February 2018 at University of Graz Austria this volume represents a wide range of research trends in the theory of commutative and non commutative rings and their modules including multiplicative ideal theory Dedekind and Krull rings and their generalizations rings of integer valued polynomials topological aspects of ring theory factorization theory in rings and semigroups and direct sum decompositions of modules The volume will be of interest to researchers seeking to extend or utilize work in these areas as well as graduate students wishing to find entryways into active areas of current research in algebra A novel aspect of the volume is an emphasis on how diverse types of algebraic structures and contexts rings modules semigroups categories may be treated with overlapping and reinforcing approaches

Combinatorial and Additive Number Theory IV Melvyn B. Nathanson, 2021-08-12 This is the fourth in a series of proceedings of the Combinatorial and Additive Number Theory CANT conferences based on talks from the 2019 and 2020 workshops at the City University of New York The latter was held online due to the COVID 19 pandemic and featured speakers from North and South America Europe and Asia The 2020 Zoom conference was the largest CANT conference in terms of the number of both lectures and participants These proceedings contain 25 peer reviewed and edited papers on current topics in number theory Held every year since 2003 at the CUNY Graduate Center the workshop surveys state of the art open problems in combinatorial and additive number theory and related parts of mathematics Topics featured in this volume include sumsets zero sum sequences minimal complements analytic and prime number theory Hausdorff dimension combinatorial and discrete geometry and Ramsey theory This selection of articles will be of relevance to both researchers and graduate students interested in current progress in number theory **Ramanujan's Notebooks** Bruce C.

Berndt, 2012-12-06 Srinivasa Ramanujan is arguably the greatest mathematician that India has produced His story is quite unusual although he had no formal education in mathematics he taught himself and managed to produce many important new results With the support of the English number theorist G H Hardy Ramanujan received a scholarship to go to England and study mathematics He died very young at the age of 32 leaving behind three notebooks containing almost 3000 theorems virtually all without proof G H Hardy and others strongly urged that notebooks be edited and published and the result is this series of books This volume deals with Chapters 1-9 of Book II each theorem is either proved or a reference to a proof is given

Chain Conditions in Commutative Rings Ali Benhissi, 2022-10-07 This book gathers in a beautifully structured way recent

findings on chain conditions in commutative algebra that were previously only available in papers The majority of chapters are self contained and all include detailed proofs a wealth of examples and solved exercises and a complete reference list The topics covered include S Noetherian S Artinian Nonnil Noetherian and Strongly Hopfian properties on commutative rings and their transfer to extensions such as polynomial and power series rings and more Though primarily intended for readers with a background in commutative rings modules polynomials and power series extension rings the book can also be used as a reference guide to support graduate level algebra courses or as a starting point for further research

Irrationality and Transcendence in Number Theory David Angell, 2021-12-30 Irrationality and Transcendence in Number Theory tells the story of irrational numbers from their discovery in the days of Pythagoras to the ideas behind the work of Baker and Mahler on transcendence in the 20th century It focuses on themes of irrationality algebraic and transcendental numbers continued fractions approximation of real numbers by rationals and relations between automata and transcendence This book serves as a guide and introduction to number theory for advanced undergraduates and early postgraduates Readers are led through the developments in number theory from ancient to modern times The book includes a wide range of exercises from routine problems to surprising and thought provoking extension material Features Uses techniques from widely diverse areas of mathematics including number theory calculus set theory complex analysis linear algebra and the theory of computation Suitable as a primary textbook for advanced undergraduate courses in number theory or as supplementary reading for interested postgraduates Each chapter concludes with an appendix setting out the basic facts needed from each topic so that the book is accessible to readers without any specific specialist background

Representation Theory of Finite Group Extensions Tullio Ceccherini-Silberstein, Fabio Scarabotti, Filippo Tolli, 2022-11-29 This monograph adopts an operational and functional analytic approach to the following problem given a short exact sequence group extension $1 \rightarrow N \rightarrow G \rightarrow H \rightarrow 1$ of finite groups describe

the irreducible representations of G by means of the structure of the group extension This problem has attracted many mathematicians including I Schur A H Clifford and G Mackey and more recently M Isaacs B Huppert Y G Berkovich E M Zhmud and J M G Fell R S Doran The main topics are on the one hand Clifford Theory and the Little Group Method of Mackey and Wigner for induced representations and on the other hand Kirillov's Orbit Method for step 2 nilpotent groups of odd order which establishes a natural and powerful correspondence between Lie rings and nilpotent groups As an application a detailed description is given of the representation theory of the alternating groups of metacyclic quaternionic dihedral groups and of the finite Heisenberg group The Little Group Method may be applied if and only if a suitable unitary 2 cocycle the Mackey obstruction is trivial To overcome this obstacle unitary projective representations are introduced and corresponding Mackey and Clifford theories are developed The commutant of an induced representation and the relative Hecke algebra is also examined Finally there is a comprehensive exposition of the theory of projective representations for finite Abelian groups which is applied to obtain a complete description of the irreducible representations of finite metabelian groups of odd order
