Dresen, Ove Stephansson, Arno Zang, 2008-01-24 Mechanical properties and fluid transport in rocks are intimately linked as deformation of a solid rock matrix immediately affects the pore space and permeability Part I of this topical volume covers mainly the nucleation and evolution of crack damage in rocks new or modified techniques to measure rock fracture toughness and a discussion of upscaling techniques relating mechanical and fluid transport behaviour in rocks at different spatial scales

Advanced Computational Approaches for Water Treatment Krunal M Gangawane, Madhuresh Dwivedi, Praveen Ghodke, 2023-10-06 A rapid growth in global industrialization and population has triggered intense environmental pollution that has led to a water crisis resulting in the decay in the quality of human life and economic losses Novel water purification techniques are expected to alleviate this challenge Recently various water purification techniques along with different computational techniques have been developed For instance water purification techniques such as electromagnetic water purification solute surface interactions in water use of micro magnetofluidic devices UV led water purification and use of membranes can be thoroughly investigated by using a range of computation techniques such as molecular dynamics the lattice Boltzmann method and the Navier Stokes method based solver *Advanced Computational Approaches for Water Treatment Applications in Food and Chemical Engineering* presents these different numerical techniques and traditional modeling and simulation approaches to elaborate on and explain the various water purification techniques Features Serves as a dedicated reference for this emerging topic Discusses state of the art developments in advanced computational techniques for water purification Brings together diverse experience in this field in one reference text Provides a roadmap for future developments in the area This book is primarily intended for chemical engineers hydrologists water resource managers civil engineers environmental engineers food scientists and food engineers interested in understanding the numerical approaches for different water purification techniques such as membrane sedimentation filtration micromagnetofluidic device and ozone UV among others **Computational Methods in Multiphase Flow III** Andrea

Alberto Mammoli, C. A. Brebbia, 2005 A common feature of multiphase flows is that a dispersed or discontinuous phase is being carried by a continuous phase for example water drops in gas flow solid particles in water flow or gas bubbles in liquid flow The overall behavior of the flow is shaped largely by the interaction between the discontinuous elements drops particles bubbles Analogue and Numerical Modelling of Crustal-scale Processes Susanne Janita Henriët Buiters, Guido

Schreurs, 2006 The crust of the Earth records the deformational processes of the inner Earth and the influence of the overlying atmosphere The state of the Earth's crust at any time is therefore the result of internal and external processes which occur on different time and spatial scales In recent years important steps forward in the understanding of such complex processes have been made by integrating theory and observations with experimental and computer models This

volume presents state of the art analogue and numerical models of processes that alter the Earth's crust. It shows the application of models in a broad range of geological problems with careful documentation of the modelling approach used. This volume contains contributions on analogue and numerical sandbox models, models of orogenic processes, models of sedimentary basins, models of surface processes and deformation, and models of faults and fluid flow.

Characterization and Behavior of Interfaces J. David Frost, 2010. Interfaces exist in every geotechnical system in many forms and at multiple scales. Although historically they are often considered to be the weak link in a system, particularly as the result of a number of unexpected catastrophic failures, new insight gained over the past twenty years by researchers around the world has shown that it is possible to select combinations of materials and design an engineered interface so that it is at least as strong as the surrounding materials. These new insights have been gained as a result of experimental study, numerical modeling, and analytical investigation of successful and failed systems. While individual technical papers have been presented and published in various forums and proceedings over the years, no technical event has ever been convened for the sole purpose of allowing for exchange of information and ideas pertaining to geotechnical interfaces. The research symposium held in September 2008 in Atlanta, Georgia, USA, in conjunction with the Fourth International Symposium on Deformation Characteristics of Geomaterials (ISAT 2008) at the Georgia Institute of Technology on 'The Characterization and Behavior of Interfaces' addressed this deficiency, and the papers presented at that event are contained in this publication. Geomechanics and Geotechnics of Particulate Media Masayuki Hyodo, Hidekazu Murata, Yukio Nakata, 2017-12-14. Microscopic re-examination of geomaterials consisting of aggregates can shed light on macroscopic behaviour, including compressibility, anisotropy, yielding, creep, cyclic liquefaction, and shear rupture. As a result of this process of examination, new methods of material characterization emerge, leading to a greater degree of accuracy in the specification of new constitutive models with physically meaningful parameters. The impetus behind this development is an increasing awareness on sustainability, leading to the more efficient use of recycled materials for geotechnical applications. The characteristics of recycled materials, such as compressibility and self-hardening, may differ significantly from those of natural materials, and it is crucial that evaluation is made from a specifically particulate perspective.
