

## Quaternary paleoecology: Reconstructing past environments

Sonia L. Fontana<sup>1</sup> and Keith D. Bennett<sup>2</sup>

July: Argentina, 19-30 August 2013

Paleo-ecological studies provide data on changes in vegetation and other aspects of the environment through time. Numerous paleo-ecological time series from around the world have demonstrated that vegetation has changed, often dramatically, since the last glacial maximum (LGM). Changes are usually attributed to various external forcing factors, including climatic change, volcanic eruptions, fire, or human activity. Additionally, vegetation has changed as a result of its own internal dynamics (Bennett and Willis 1995), which include migration, competition and succession across different timescales. An example of postglacial changes in vegetation from southern most South America is illustrated in Figure 1; it specifies the different processes that have caused vegetation changes since the LGM (Fontana and Bennett 2012). Distinguishing these forcing factors of environmental change is challenging, especially when they operate and interact at different spatial and temporal scales (Fontana et al. 2012).

The purpose of this workshop was to bring together Latin American researchers working on Quaternary environmental change to discuss and build up a network, exchange perspectives and promote international interactions. Forty-two senior and early career scientists, and postgraduate students from Mexico, Venezuela, Colombia, Brazil, Bolivia, Chile and Argentina attended the meeting. A broad range of expertise was represented covering paleontology, diatoms, ostracods, foraminifera, macroplankton, charophytes, phytolite, dendrochronology and archaeology.

The workshop provided: (1) an overview of the spatial and evolutionary responses of organisms to different Quaternary driving forces, with the aim of providing insight into general questions of species survival, spread and biodiversity; (2) an outline of the principles, methods and applications of selected paleo-ecological techniques; and (3) an overview of methods and software used for data analyses.

The event comprised lectures, practical classes, poster presentations, a field trip and the dissemination of a joint research project. The lectures addressed the paleoecology of the ocean, long Quaternary terrestrial records with multiple glacial isostatic sea level records, an overview of key sites for the last glacial-interglacial transition, palaeogenetics (including molecular clocks and ancient DNA), refugia, individualistic communities, plant migration, late Quaternary extinctions, and consideration of the role of Quaternary events on the

**Figure 1:** Pollen percentages diagram of collected lake from Lake Baikal, indicating different processes that have caused main vegetation change since the LGM. MBZ indicates the position of the higher layer from the Mt. Baikal 2 section, Fozzov modified from Fozzov and Bessonov (2012).

evolution of organisms. Important discussions centered around data collection issues: site selection and coring, subsampling techniques, routine sediment analyses, overview of pollen and macrofossil analyses and the value of multi-disciplinary research in paleoenvironmental reconstructions. The practical classes focused on data handling: chronology, the radiocarbon method and calibration, zonation, rates of change, ordination techniques and diversity estimators.

A field trip to Laguna Rincón de los Rios took place, following which participants engaged in the Latin American cooperative project for young scientists, Synergy Latina, and designed a multi-disciplinary research project with the main goal being to disentangle possible interactions between the environment and humans of the Atlixco of northern Argentina. Attention was paid to the influence that climatic changes had on the development of Andean civilizations and the consequent impact of human activities on the landscape. The initial phase of this project was conducted during the course (describing and sub-sampling the sediment core), while the different analyses will be carried out at a later stage, at the participants' home institutions.

This first workshop was hosted by the University of Jujuy and co-ordinated by Julio Kallmeyer and Liliana Lupo. It was a successful start to the task of enhancing paleoecological investigations in Latin America and we look

forward to larger scale joint investigations, the ongoing exchange of knowledge leading to the development of new ideas and research questions, and continued cooperation. Further annual workshops are planned.

In addition to PAGES, participants received support from their home institutions, universities and research councils. The CHRONO Centre at Queen's University Belfast, financially supported and ran the radio-carbon dating of the sediment records for the Synergy Iuxina project.
