Infant Nutrition B. A. Rolls, Ann Walker, 2013-11-11 Few people doubt that the mother's milk provides the best food for the full term infant during the first few months of life when the digestive absorptive and excretory systems are relatively immature The development of the digestive enzymes is detailed in Chapter 4 The significance of this immaturity first emerged as a consequence of the pioneering work of Professor Robert McCance and Dr Elsie Widdowson in human nutrition when they studied the electrolyte and nitrogen excretion of babies and young animals To quote Professor McCance Inefficient though the kidneys were by adult standards they were capable of maintaining homeostasis provided the infant and animals were growing while being fed on food of exactly the right composition that is the milk of the mother Ashwell 1993 One should not forget that although the mother protects the developing baby against much nutritional abuse the baby may be still be affected by maternal nutrition and this is discussed in Chapter 2 The superior qualities of breast milk are still recognized and research continues to discover yet more factors in breast milk significant to the health of the baby for possible inclusion in formulas The immature stage of development of the baby means that while enough nutrients for optimal growth of all tissues are required excessive quantities may cause intoxication Tight specifications are essential since unlike the adult the newborn depends on a single food

Nutrition, An Issue of Clinics in Perinatology Brenda Poindexter, 2014-06-28 Over the past several decades advances in neonatal nutrition have focused on the provision of early parenteral nutrition and the development of formulas and supplements that most closely approximate maternal breast milk The overall outcomes for infants including premature infants have greatly benefited from these advances but there are still many nutritional unknowns that impact the lives of neonates This is an exciting time in neonatal nutrition as the focus has shifted from survival and growth which are still important goals to effects of each micro macronutrient on development prevention of disease states such as ROP the effects of neonatal nutrition on future health as an adult and opportunities to improve long term neurodevelopmental outcomes by optimal early nutrition This issue focuses on aspects of enteral and parenteral nutrition that are at the forefront of neonatal care assessing growth parenteral nutrition components including alternate lipid formulations optimal storage and use of human milk including donor milk post discharge nutrition and the effects of various micro macronutrients on long term developmental outcomes It is anticipated that the study and implementation of many of these novel concepts into the care of neonates many of whom are severely premature will be of value to practitioners researchers and most of all patients
